1 STUDY OVERVIEW

1.1 INTRODUCTION

The NE Polk US 27 Mobility Study is intended to support the Florida Department of Transportation (FDOT) District One and its transportation partners in defining a multimodal program of improvement projects and strategies. The overall objective of the Study is to improve the mobility, safety, and livability along the US 27 corridor. This multimodal plan will address congestion and mobility issues on US 27 by developing Context-Sensitive Solutions, and documenting improvement strategies.

The purpose of the NE Polk US 27 Mobility Study is to engage local and regional project stakeholders to identify mobility needs and establish planning goals and values that lead to implementation of improvement strategies. Through a collaborative regional consensus process, a multimodal program of projects and strategies is being defined that will improve mobility, safety, and livability for all users. This includes an emphasis on freight. Addressing congestion and mobility issues requires context-sensitive solutions that not only look at improving mobility and safety but also balance those improvements with defined community values. The study outcome will include a set of recommended multimodal strategies and improvements.

The Mobility Study is being conducted in three phases.

- *Phase One: Define the Problem.* The goal of this effort is to define the problem(s) through initial stakeholder outreach, data collection, and reviews of previous studies. Existing travel demand and operations characteristics were assessed, and land use and community characteristics evaluated. A roadway safety audit was conducted, and existing or short-term issues and opportunities identified.

- *Phase Two: Define Guiding Principles.* The focus of this effort is establishing a vision for the corridor. This involves developing guiding principles and forming purpose and need statements. In addition, evaluation criteria and measures of success are being defined, and future travel demand and operations characteristics evaluated. The long-range needs are being identified in this phase.

- In the last phase, *Phase Three: Define and Select Alternatives*, efforts will be centered on defining, assessing, evaluating, documenting, and preparing alternatives for implementation. This phase will identify the viable alternatives to be carried forward and determine the appropriate method for programming and implementing projects.

The purpose of the Existing Conditions Report is to document the data collection, research and existing conditions analysis completed for US 27 during Phase I as part of the NE Polk US 27 Mobility Study.

1.2 STUDY AREA

US 27 is part of the Strategic Intermodal System (SIS) and is a critical north/south route for freight traffic throughout the state. The NE Polk US 27 Mobility Study corridor spans a 32-mile section of US 27 from SR 60 (which is the southern limit of the study area) to US 192 at the Polk County/Lake County line (which is the northern limit of the study area). Depicted in **Figure 1-1**, the broader study area includes the study section of US 27, as well as other key crossroads and parallel roadways that have an impact on US 27 and are impacted by conditions on US 27.

Table 1-1 presents the preliminary list of study intersections along the study section of US 27. The intersections along US 27 were reviewed looking at Annual Average Daily Traffic (AADT) available from the FDOT Traffic Online application, number of lanes on the cross streets, pavement condition, signalization/channelization, and access to residential areas. All 33 existing signalized intersections between SR 60 and US 192 were identified as the key study intersections to be analyzed in Phase 1, along with the unsignalized interchanges of US 192 and US 17. In addition, through coordination with FDOT District One Traffic Operations staff, all 14 unsignalized intersections with full median openings on US 27 between SR 60 and US 192 were identified as key study intersections. **Figure 1-2** depicts the location and lane configuration of each study intersection along the US 27 corridor where existing conditions were assessed.

2 OTHER STUDIES AND PLANNED IMPROVEMENTS

2.1 PREVIOUS STUDIES

Available studies and reports previously developed by FDOT and other agencies for transportation facilities within the study area were reviewed. The information from these studies provides historical context and insight into the issues and opportunities surrounding the US 27 corridor and study area. In addition, valid data and analysis documented in other studies was considered and utilized wherever possible for the NE Polk US 27 Mobility Study. This includes traffic count data available from previous FDOT District One Traffic Operations reports, and physical characteristics information for locations along the US 27 corridor from the FDOT Central Office US 27 Multimodal Corridor Study.

Table 2-1 provides a list of the previous and ongoing studies that were reviewed. **Table A-1** in **Appendix A** contains more information about each of the reference files that were reviewed along with brief notes regarding the key information available from each source.

In January and February 2019, available comprehensive plans for Polk County and the municipalities within the study area were obtained. The land use elements and transportation elements were reviewed to ascertain information related to the US 27 corridor and study area. The following comprehensive plans were reviewed:

- Polk County 2030 Comprehensive Plan
- City of Davenport 2030 Comprehensive Plan
- Town of Dundee 2030 Comprehensive Plan
- Village of Highland Park Comprehensive Plan
- Town of Lake Hamilton Comprehensive Plan
- City of Lake Wales 2015 Comprehensive Plan
- City of Winter Haven Comprehensive Plan

Most of the comprehensive plans identified significant expected development within the regional study area along with emerging regional activity centers. In addition, most of the comprehensive plans identified roadway improvement projects needed on US 27 or adjacent to US 27. These included the widening of US 27, nearby intersections, and various interchange projects. Key information from other select studies is summarized below.

Polk Transportation Planning Organization (TPO) Momentum 2040 Long Range Transportation Plan (LRTP)

Polk TPO's long range plan, adopted December 2015, includes the county's multimodal goals, objectives, performance measures, and transportation projects that are needed and can be funded through a year 2040 planning horizon. The Cost Feasible portion of the Plan includes US 27 road widening from the Highlands County line to SR-60, and improvements from Highlands County Line to President's Drive.

Eight US 27 intersection projects are listed as illustrative projects or partially funded through 2040. Improvements to the SR 60 and US 27 interchange are identified as unfunded needs. The plan includes Central Polk Parkway as an illustrative project, and a Complete Streets Future Candidate Corridor is identified on US 17/92 ending at US 27, near Haines City. A SunRail Staging Concept is shown in the LRTP utilizing part of US 27 for an extension, express bus service and a planned station. Several unfunded multi-use trail segments and bicycle/pedestrian corridors end at or intersect US 27, while segments of US 27 are also considered for complete streets or other bicycle/pedestrian improvements.

FDOT District One, Freight Mobility & Trade Plan, 2016

The District's plan defined a regional freight transportation network and identified regional freight investment priorities needed to sustain economic growth in the region. It also provided input to the Florida Freight Mobility and Trade Plan (FMTP) Investment Element. This plan may be used to support requests for federal and state funding for enhancements or improvements to the existing regional freight network. Freight Mobility Corridors (FMCs), Intermodal Logistics Centers (ILCs) and Freight Activity Centers (FACs) within the regional study area are identified, including US 27 as a FMC, the Central Florida CSX ILC located north of SR 60 and west of US 27, and multiple FACs located adjacent to the US 27 corridor between SR 60 and US 192.

FDOT District Four, US 27 Multimodal Planning and Conceptual Engineering (PACE) Study, 2012

This District Four study developed traffic forecasts, conceptual engineering alternatives, cost estimates, and noted environmental impacts to help determine the feasibility of rail along US 27 in south Florida (Miami-Dade, Broward, and Palm Beach counties). Roadway and railroad improvements were studied along 72 miles of US 27 from the Homestead Extension of Florida's Turnpike (HEFT) in Miami-Dade County to the Palm Beach/Hendry County line. Future US 27 roadway widening was shown to be needed, and construction of a new railroad along Krome Avenue to a potential future ILC near Belle Glade was found to be physically feasible. Implementation was predicated on potential future development of a new ILC near Lake Okeechobee, and private funding necessary to operate and maintain freight train service along the railroad.

FDOT District One, Central Polk Parkway PD&E Study, 2011 to present

The Central Polk Parkway (CPP) project was first proposed in 2008. FDOT conducted a PD&E Study for a new 6-lane limited access facility extending from Polk Parkway/SR 570 to SR 60 (western portion), and from SR 60 north to I-4 (eastern portion). A State Environmental Impact (SEIR) document was produced in 2011. The new roadway was planned as a tolled facility and broken into eight segments. The project was considered a long-term alternative that could relieve traffic congestion on US 27 and other roads in the study area. FDOT cancelled work on the project in December 2015, primarily due to the cost of the project and low traffic volumes. However, in January 2018, the Polk TPO voted to support an 8-mile segment of the road from SR 570/Polk Parkway to SR 60 (the western portion). Consequently, Florida's Turnpike Enterprise has funded Project Development and Environment, Design, and Right of Way phases for the CPP from SR 570 to US 17 (the first segment of the western portion).

Central Florida Expressway Authority (CFX) Poinciana Parkway PD&E Study, Ongoing

CFX is currently conducting a Project Development and Environment (PD&E) Study for an extension of the Poinciana Parkway, a new toll road. CFX is evaluating alternatives for a new alignment connecting the existing Poinciana Parkway to CR 532, an interchange with US 17/92, and a potential future I-4 connection. Project information is being shared with FDOT District One for consideration in the NE Polk US 27 Mobility Study.

My Ride - Polk TPO Transit Development Plan (TDP) for FY 2017 – FY 2026

The Transportation Development Plan (TDP) is a guiding document for the Polk County TPO Transportation Improvement Program (TIP), as well as the FDOT five-year work program, for public transportation in the county. The TDP provided transit route information, 2017 average weekday ridership, and population distribution information across Polk County. Six routes are noted in the TDP that run on a portion of the US 27 corridor. They are:

- Route 15 (Winter Haven/Haines City),
- Route 27x (Dundee/Eagle Ridge Mall),
- Route 30 (Legoland),
- Route 35 (Lake Wales/Babson Park/Frostproof),
- Route 416 (Poinciana/Haines City LYNX), and
- Route 427 (US 27/Haines City LYNX).

According to the TDP, for transit market share to increase, service expansion would need to occur. Route 15 [Winter Haven/Haines City] and Route 427 [US 27/Haines City] rank as a priority for service improvements to traditional fixed routes. An express feeder route between the Winter Haven Terminal and Poinciana SunRail Station was also identified as a service expansion priority. A SunRail express feeder is proposed for five stops, along with Park 'n Ride lots.

A Technical Report for Evaluation of SunRail Extensions into Polk County

This technical memorandum prepared for the Polk TPO evaluates a possible extension of SunRail into Polk County, in support of the 2040 Long Range Transportation Plan Update. The memorandum covers the following topics:

- potential staging alternatives
- conceptual site considerations
- conceptual feeder bus services
- ridership propensity analysis
- financial estimates
- institutional considerations.

A proposed SunRail spur was discussed, and alternatives were considered for extending SunRail into Polk County. A potential staging sequence for development of a SunRail extension with 4 phases was noted. Station locations were screened, and 10 possible locations were identified. Conceptual feeder bus services were also identified to support the various staging alternatives.

Since a SunRail extension would utilize existing train tracks through the study area, there is little impact expected to the primary roadway network. However, proposed station locations influence connections along the secondary roadway network and bus service between destinations, as well as where economic development nodes may evolve. These things become important considerations as the study looks at alternative routes that alleviate traffic demand on US 27, especially in the larger context of east/west regional connections.

Given improvements to US 27, the project would significantly enhance connections from Polk County to Orlando International Airport for both passengers and employees. In addition, a spur could potentially provide long distance passenger train options to West Palm Beach, Fort Lauderdale, and Miami if the proposed Virgin Trains Orlando extension project ties into SunRail at the Orlando airport. These connections may increase the value of a SunRail extension into Polk County.

2.2 ONGOING STUDIES BY OTHERS

FDOT Central Office and the Florida's Turnpike Enterprise are conducting studies of portions of US 27 that overlap with the NE Polk US 27 Mobility Study area. While these two studies have different project limits and different objectives than the NE Polk US 27 Mobility Study, their information is being considered in the NE Polk US 27 Mobility Study.

FDOT Central Office conducted a *US 27 Multimodal Corridor Study*, which concluded in early February 2019. The study area was from Miami-Dade County to Central Florida and included the portion of US 27 from the Florida Turnpike interchange in Lake County to the Palmetto Expressway near the city of Hialeah, Dade County. The study area also covered surrounding counties impacted by growth and development along the US 27 corridor. The study was initiated to gather existing conditions data, provide analysis, and gather stakeholders, and. an Existing Conditions Data Study report, dated February 15, 2019, was produced. This report included a series of maps summarizing existing conditions along the corridor, and information for the portion of US 27 from SR 60 to US 192 is being used for the FDOT District One NE Polk US 27 Mobility Study.

Florida's Turnpike Enterprise is evaluating the feasibility of adding limited access lanes to US 27 between SR 60 and I-4. Potential constraints being assessed include the US 27 and I-4 interchange; the US 27 and SR 60 interchange; bridge structures along US 27; and access/driveways along US 27 considering modifications may be needed to accommodate the limited access lanes. This US 27 Feasibility Study, which began in the spring of 2018, has a smaller study area than the NE Polk US 27 Mobility Study and is focused on just one improvement concept: limited access lanes on US 27. Relevant information from the Turnpike's US 27 Feasibility Study will be considered as appropriate in the NE Polk US 27 Mobility Study.

2.3 PLANNED AND PROGRAMMED IMPROVEMENTS

Ongoing and upcoming planned and programmed (aka committed) transportation projects were identified from each of the funding plans that were reviewed. Planned and programmed improvements will be assumed to be in place following the year(s) after construction is funded. This will be considered during the future conditions analysis of the US 27 corridor and surrounding study area.

The latest available local public agency funding plans were obtained in January and February 2019, from each agency's website. The available Capital Improvement Plans/Programs (CIP), or Transportation Improvement Plans/Programs (TIP) for Polk County and for each of the municipalities were obtained, along with the FDOT Five Year Work Program, FDOT Strategic Intermodal System (SIS) funding plans, and the Polk TPO Transportation Improvement Program (TIP). These funding plans were reviewed to identify planned and programmed/funded transportation projects within the study area.

The following local public agency transportation funding plans were reviewed:

- Haines City adopted FY 18/19 budget
- City of Davenport proposed operating budget & Five-Year Capital Improvement Plan
- City of Lake Wales Five Year Capital Improvement Plan
- Winter Haven FY 18/19 operating & FY 19/20 planned operating budget
- Town of Lake Hamilton Capital Improvement Program FY 2017-2022
- Town of Dundee 2018-2019 Annual Adopted Budget
- Highland Park Final 2016 – 2017 Budget Summary
- Polk County FY 2018 & 2019 Biennial Budget

Many of the local municipal plans included transportation projects within the study area. Local public agency projects found from these plans, are noted in **Table A-1** in **Appendix A**. In addition, the Polk TPO 2040 Long Range Transportation Plan includes maps of proposed local public agency roadway projects. These include maps for the Haines City / Davenport area, and the NE Polk County area which show proposed road improvements located within the regional study area. A copy of these two maps is included in **Appendix A**.

The Polk TPO's latest adopted 5-year Transportation Improvement Plan (TIP) and 2040 LRTP were reviewed and all multimodal improvements in the study area noted. A copy of the relevant LRTP maps and tables is included in **Appendix A**. In addition, projects within the study area from the FDOT District One adopted Work Program for fiscal years 2020 through 2024, and from the SIS 1st Five Year Plan, SIS 2nd Five Year Plan, SIS Cost Feasible Plan, and SIS Multimodal Unfunded Needs Plan were noted. A summary table with the planned and programmed project names, numbers, limits, and brief description of the work was created. **Table 2-2** is provided on the following page.

TABLE 2-2: PLANNED AND PROGRAMMED IMPROVEMENT PROJECTS

Plan	Project #	Project Description	Project Location	Limits (from)	(to)	Funded Phase(s)	Funded Year(s)
Polk TPO TIP Draft FY 2019/2020 (online 7/18/19) & FDOT 5 Year Work Program FY 2020-2024	442116-1	Intersection Lighting	US 27	at Polo Park		PE, CON	2020, 2021

3 TRANSPORTATION DATA

3.1 HISTORIC TRAFFIC COUNT DATA

Historic traffic count data available from FDOT, TPO, Polk County, and others was obtained for the project. The major sources of traffic count data from recent projects were mapped to serve as a single source of information. Major recent projects with valuable count data used for this study include:

- All count data from Florida Traffic Online (FTO) sites in the study area
- US 27 Intersection Analysis Study from Washington Avenue to Home Run Boulevard/Posner Boulevard (by FDOT District 1)
- I-4 Selected Interchanges Analysis Report (by FDOT District 1)
- I-4 Beyond the Ultimate Project (Systems Access Modification Report) (by FDOT District 5)
- US 27 PD&E Study from the Highlands County line to SR 60 (by FDOT District 1)

3.2 TRAFFIC DATA COLLECTED

Traffic counts were conducted in association with this study, including 24-, 48-, and 72-hour volume/classification counts and intersection turning movement counts. Such turning movement counts were collected during the AM peak period (6:30am-10:30am) and PM peak period (3:00pm-7:00pm) on a typical weekday in November and December 2018. This data included pedestrian and bicycle counts at each location.

The locations where each type of traffic volume count was collected along with the data sources are depicted in **Figure 3-1**. A list of these counts, along with the source, location, dates and times when each count was conducted, is documented in **Appendix B**. These traffic counts were used to determine the project specific AM and PM peak study hours used in subsequent analyses. The resultant project specific AM peak hour was determined to be between 7:15 AM and 8:15 AM, while the project specific PM peak hour is between 4:45 PM and 5:45 PM.

3.2.1 Machine Counts

AADT data from FTO and 24-hour, 48-hour, and 72-hour vehicle counts conducted between 2016 and 2019 at the locations identified in **Figure 3-1** were used in the development of the existing year traffic. The count data is included in **Appendix C**.

3.2.2 Intersection Turning Movement Counts

Recent intersection turning movement counts that were conducted as part of other studies along the US 27 corridor were obtained and used for this study. Additional intersection turning movement counts were necessary to be collected to augment previous data. These counts come from the following sources:

- I-4 SIAR (202080-1-12-05)
- D1 US 27 Intersection Study (436417-1-32-01)

For study intersections where data was not available, 8-hour turning movement counts were conducted in November and December of 2018. All study intersection turning movement counts and their sources are noted in **Figure 3-1**. The intersection turning movement count data can be found in **Appendix C**.

FIGURE 3-1
TRAFFIC COUNT DATA

3.3 EXISTING TRAFFIC DATA AND FACTORS

In order to develop Annual Average Daily Traffic (AADT) volumes, the bi-directional counts were adjusted by appropriate factors based on the type of count and when it was conducted. All volume and classification counts, conducted as part of this study or otherwise, were seasonally adjusted using a seasonal factor appropriate to the week the count was conducted. Additionally, all volume counts were adjusted using an axle adjustment factor appropriate to the week the count was conducted. Traffic adjustment factors are documented in **Appendix D** and calculated AADTs are documented in **Appendix E**.

AADT counts collected prior to 2018 were increased by an assumed 2% annual growth rate to simulate 2018 conditions. All counts were rounded in accordance with rounding standards from the FDOT *Project Traffic Forecasting Handbook* and AASHTO Green Book – A Policy on Geometric Design of Highways and Streets, 6th Edition, 2011.

Turning movement counts conducted earlier than 2018 were also adjusted using an assumed 2% annual growth rate to simulate 2018 conditions. Balancing turning movement volumes along the project corridor was considered but after inspection of each segment between intersections, it was ultimately dismissed. Most roadway segments along the project corridor have potential volume breaks in the form of minor cross road connections and driveway access points. The traffic adjustment factors from the reports in **Appendix D** were used.

Traffic factors that will be carried into future year analysis include K factors, Directional Distribution (D) factors, Truck (T) factors and Peak Hour Factors (PHFs). The K factor is the ratio of traffic volume in the study hour to the Annual Average Daily Traffic (AADT). A 9.0% standard K factor was used for all US 27 segments between SR 60 and US 192, as well as for the other arterial study roadways associated with the project's study intersections. This is consistent with the standard K factors published by FDOT. The K factors for all non-arterial cross streets were calculated by dividing the highest peak hour bi-directional volume, derived from the turning movement counts, by the calculated 2018 AADT. The D factors for US 27 were obtained from FTO count sites within the project study limits, while the D factors for all cross streets were determined from the existing traffic count data collected. Directional distribution factors that fell outside the acceptable ranges presented in the FDOT *Project Traffic Forecasting Handbook* were adjusted accordingly.

Similarly, T factors for US 27 were obtained from FTO count sites within the project study limits, and factors utilized for all cross streets were determined from the existing count data collected. Historical AADT FTO Reports used to obtain the K, D, and T factors are provided in **Appendix D**.

The K, D, and T factors are summarized in **Table 3-1** for US 27 and **Table 3-2** for the cross streets.

TABLE 3-1: US 27 TRAFFIC FACTORS (2018)

Roadway		Location	Count Station	K Factor	D Factor	T_{24} Factor

3.4 BICYCLE AND PEDESTRIAN FACILITIES

3.4.1 Bicycle Facilities

For this report, bicycle facilities are considered present if one or more of the following conditions are met:

- Bicycle lane pavement markings
- Bicycle "keyhole" configurations where turn lanes are present
- A minimum 5-foot wide paved shoulder
    - (*Note: Current FDOT design standard for new construction projects is a 7-foot wide buffered bicycle lane with double 6-inch white lines.)*

Bicycle facilities are considered present on this corridor if there is a paved shoulder 5-foot wide or wider. These facilities are generally not designated as bicycle lanes with pavement markings and therefore not bicycle-exclusive. There are keyhole lanes near intersections with turn lane configurations throughout approximately half of the study area. However, these keyhole lanes do not match the latest FDOT Design Manual (published January 1, 2018), which includes bicycle pavement markings. The various bicycle facility features present along the study corridor are graphically summarized in **Figure 3-2**.

3.4.2 Pedestrian Facilities

Pedestrian facilities are typically paved paths available for use by people traveling on foot or while in a wheelchair. The FDOT Design Manual also considers the following to be pedestrian facilities:

- Sidewalks
- Curb ramps
- Crosswalks
- At-grade railroad crossings
- Refuge islands
- Curb extensions
- Pedestrian signals
- Public transit loading zones
- Pedestrian bridges
- Shared use paths
- Street furniture

The primary pedestrian facilities located in the corridor study area are sidewalks. However, sidewalks are largely absent or sporadically located from SR 60 until approximately Mile Post 23, near Ernie Caldwell Boulevard. Per FDOT standards, sidewalks are to be provided on both high speed curbed and flush shoulder roadways within C2T, C3R, C4, C5 or C6 context classifications and within C1, C2 or C3C where demand is demonstrated. The existing and future context classifications within this corridor are C3R, C4, C2 and C3C, which coincides with the classifications where sidewalks are to be provided. (Context classifications are described further in Section 4.5 of this report.)

Sidewalk facilities are present in the following locations:

- Central Avenue to Harding Avenue (both sides)
- South of Lincoln Avenue to Winter Haven/Lake Hamilton boundary (both sides)
- 1,000 feet south of Crump Road to 800 feet north of Crump Road (both sides)
- W Johnson Avenue to Intermart Shopping Center Entrance (both sides)/Blue Heron Boulevard (right side)
- Toyota Entrance (left side)/Bates Road (right side) to Lowes Entrance

In order of decreasing priority, the location of sidewalks is to be as near the right of way line as possible, outside of the clear zone, five feet beyond the limits of the full width shoulder or at the limits of the full width shoulder.

There are generally sidewalk facilities located on both sides of the corridor from Ernie Caldwell Boulevard to the northern terminus of the study area. Curb cuts are provided where sidewalks meet the roadway.

Pedestrian crossings designated by pavement markings are generally located on all legs of signalized intersections. There are a few exceptions listed and described below:

- Eagle Ridge Mall Entrance – No pedestrian markings across the south and west legs of intersection (appropriate since there is no west leg of the intersection)
- Ridgewood Lakes Road – No pedestrian markings
- Cottonwood Road – No pedestrian markings
- Home Run Boulevard/Posner Boulevard– No pedestrian marking across north leg of intersection
- Frontage Road – No pedestrian marking across south and east legs of intersection
- Hampton Inn Entrance – No pedestrian marking across west and north legs of intersection
- Potras Road 2 – No pedestrian marking across north and south legs of intersection

Figure 3-3 illustrates where existing pedestrian sidewalk facilities are located throughout the corridor.

3.5 TRANSIT FACILITIES

The Lakeland Area Mass Transit District (LAMTD) administers and operates Citrus Connection, which includes all public transportation within Polk County. Citrus Connection provides 24 fixed-route service lines, with a fleet of 41 buses. An additional three routes within the county are paid for by Polk County and operated via a contract with LYNX.

Citrus Connection also operates paratransit service, offering shared rides for those who are unable to use regular fixed-route buses. It is a call ahead, door-to-door service available to senior citizens, disadvantaged citizens, and citizens with disabilities. It uses a specialized fleet of small, wheelchair lift-equipped buses. There are no restrictions on the purpose or number of service trips that may be taken, except that the ride is shared with others traveling at the same time in the same direction. It operates six days a week and reservations are taken from 8:00 am to 5:00 pm weekdays and 8:00 am to 4:00 pm on Saturday. There is no paratransit service on Sunday or most major holidays.

3.5.1 Transit Routes

There are 12 routes serving the east portion of Polk County, an area generally corresponding with the NE Polk US 27 project area study limits. These routes are:

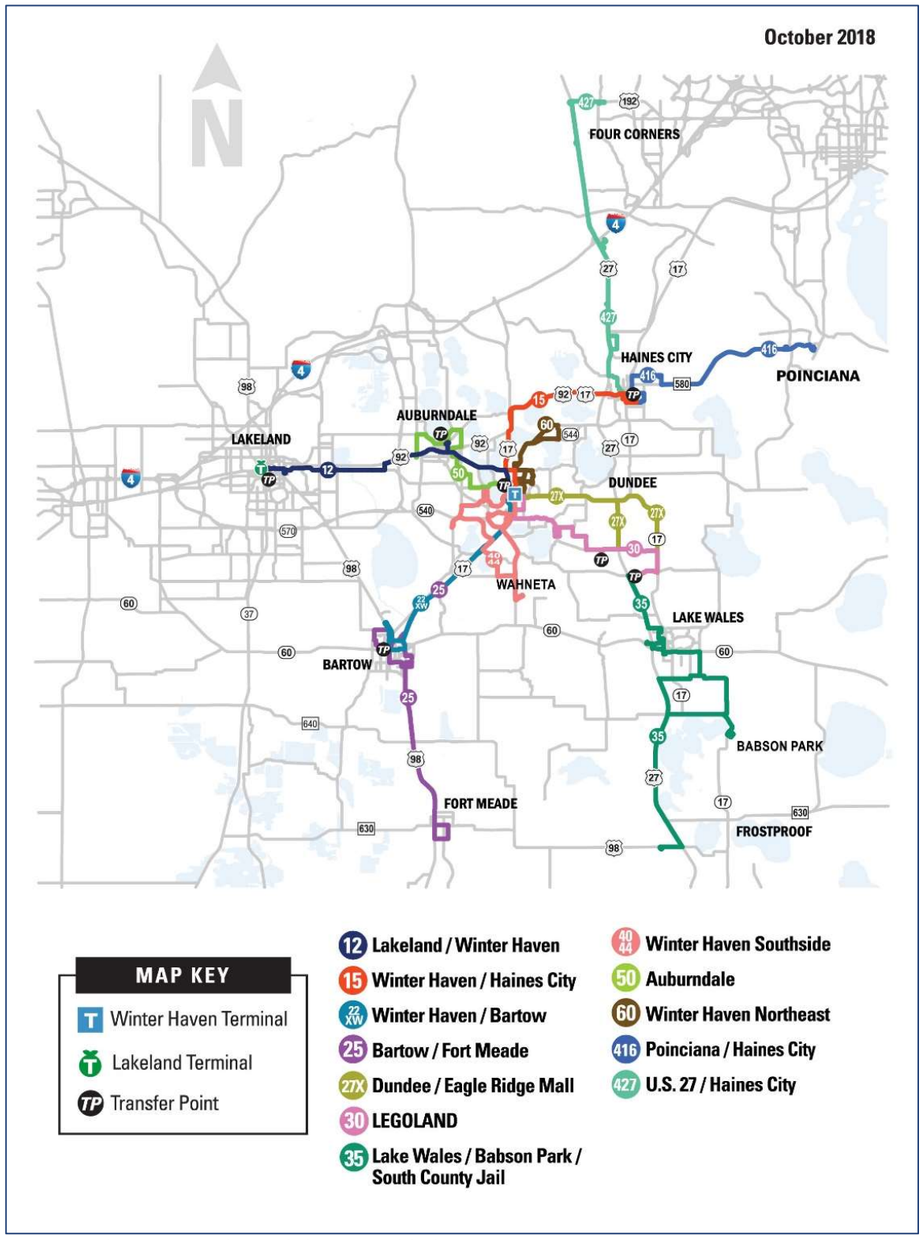
- Route 12 Lakeland / Winter Haven
- Route 15 Winter Haven / Haines City
- Route 22XW Winter Haven / Bartow
- Route 25 Bartow / Fort Meade
- Route 27X Dundee / Eagle Ridge Mall
- Route 30 LEGOLAND
- Route 35 Lake Wales / Babson Park / South County Jail
- Route 40/44 Winter Haven Southside
- Route 50 Auburndale
- Route 60 Winter Haven Northeast
- Route 416 Poinciana / Haines City
- Route 427 US 27 / Haines City

Additionally, two new routes are scheduled to begin service on October 1, 2019:

- Lake Wales/Haines City Express
- Loughman Flex

The existing Citrus Connection bus routes and service plans within the regional study area are provided in **Appendix F**. The transit routes are depicted on **Figure 3-4**.

FIGURE 3-4: TRANSIT ROUTES



SOURCE: Citrus Connection website (www.ridecitrus.com)

3.5.2 Terminals

There are two terminals serving the east county routes:

- Lakeland Downtown Terminal
- Winter Haven Downtown Terminal

3.5.3 Stops

Transit stops along the east county routes provide a wide range of amenities. Some have only a transit identification sign, while others have a combination of benches, shelters, trash cans, and bicycle racks. Not all stops are ADA accessible.

3.5.4 Transfer Locations

Transfer locations between routes are identified as follows:

On Route 12

- Lakeland Downtown Terminal: Routes 1, 3, 10, 14, 15, 22XW, 45, 46, and 58
- Winter Haven Downtown Terminal: Routes 15, 22XW, 27X, 30, 40/44, 50 and 60
- Auburndale Civic Center: Route 50

On Route 15

- Winter Haven Downtown Terminal: Routes 12, 22XW, 27X, 30, 40/44, 50 and 60
- Haines City Plaza: Routes 416 and 427

On Route 22XW

- Winter Haven Downtown Terminal: Routes 12, 15, 27X, 30, 40/44, 50 and 60
- Polk County Courthouse: Route 22XL, 25

On Route 25

- Polk County Courthouse: Route 22XW, 22XL

On Route 27X

- Winter Haven Downtown Terminal: Routes 12, 15, 22XW, 30, 40/44, 50 and 60
- Eagle Ridge Mall: Routes 30 and 35

On Route 30

- Winter Haven Downtown Terminal: Routes 12, 15, 22XW, 27X, 40/44, 50 and 60
- Eagle Ridge Mall: Route 35
- Walmart Supercenter: Route 27X

On Route 35

- Eagle Ridge Mall: Route 30

On Route 40/44

- Winter Haven Downtown Terminal: Routes 12, 15, 22XW, 27X, 30, 50 and 60

On Route 50

- Winter Haven Downtown Terminal: Routes 12, 15, 22XW, 27X, 30, 40/44 and 60
- Auburndale Civic Center: Route 12

On Route 60

- Winter Haven Downtown Terminal: Routes 12, 15, 22XW, 27X, 30, 40/44 and 50

On Route 416

- Haines City Plaza: Routes 15 and 427

On Route 427

- Haines City Plaza: Routes 15 and 416

On Lake Wales/Haines City Express (beginning October 1, 2019)

- Health Dept. at Lake Wales Plaza: Route 35
- Eagle Ridge Mall: Routes 15 and 27X
- Dundee Police Station: Route 27X
- Haines City Plaza: Routes 15, 416 and 427

On Loughman Flex (beginning October 1, 2019)

- Posner Park: Route 427

3.5.5 Service (days and times)

Service span for east county routes is shown in **Table 3-3** below.

TABLE 3-3: TRANSIT SERVICE

Route	Service Span (weekday)	Service Span (weekend)
12	6:15a – 7:03p	7:15a – 4:03 Sat
15	5:45a – 7:00p	6:45a – 3:00p Sat
22XW	5:45a – 7:04p	8:15a – 1:34p Sat
25	5:45a – 5:53p	---
27X	6:00a – 7:05p	---
30	6:15a – 7:00p	7:15a – 4:00p Sat 8:15a – 3:00pSun
35	6:15a – 7:05p	7:15a – 4:05p Sat
40/44	5:45a – 7:02p	6:45a – 3:02p Sat
50	5:45a – 7:05p	8:15a – 1:35p Sat
60	6:15a – 7:04p	---
416	5:40a – 7:00p	7:05a – 3:20p Sat
427	5:25a – 7:12p	6:50a – 3:33p Sat
Lake Wales/Haines City	TBD	TBD
Loughman Flex (Oct. 1)	TBD	TBD

Note: TBD = To Be Determined

Transit service is generally provided between 6:00 am and 7:00 pm for most routes within the study area on weekdays. Nine of the routes have some service on Saturdays, generally from morning to early afternoon. Route 30 – Legoland, is the only route that has service on Sunday. Service is provided on Route 30 from 8:15 am to 3:00 pm on Sundays.

3.5.6 Headways

Headways for east county routes (based on schedules effective Oct. 1, 2018) are shown in **Table 3-4**.

TABLE 3-4: TRANSIT HEADWAYS

Route	Frequency (weekday)	Frequency (weekend)
12	:60	2:00
15	1:30	3:00
22XW	1:30	4:00
25	1:30	---
27X	varies	---
30	:60	2:00
35	2:00	2:00
40/44	1:30	3:00
50	1:30	4:00
60	:60	---
416	1:30	2:00
427	:60	2:00

Six of the 12 routes have a 1.5-hour headway between busses, four of the routes have an hour between busses, one route has two hours between busses, and one route has variable headways.

3.5.7 Ridership

Utilizing data from the Polk Transit Development Plan, average weekday ridership for east county routes in 2017 is summarized in **Table 3-5**.

TABLE 3-5: TRANSIT RIDERSHIP (2017)

Route	Ridership
12	218
15	293
22XW	121
25	77
27X	2
30	272
35	127
40/44	79
50	130
60	88
416	24
427	92

The highest ridership is on Route 15 which runs between Winter Haven and Haines City along US 17/92. The second highest ridership is on Route 30 which runs between the Winter Haven Downtown Terminal and the Eagle Ridge Mall along portions of Cypress Gardens Road and Waverly Road. Route 427 which runs along US 27 has an average weekday ridership of 92.

3.5.8 Future Plans - SunRail

SunRail is a Central Florida passenger rail system serving the City of Orlando, and Volusia, Seminole, Orange and Osceola counties. It opened in 2014 and has expanded to now include 49 miles and 16 stations in four counties. It makes 40 trips per day. SunRail operates double-decker passenger rail cars on 30-minute headways during morning and afternoon peak periods and on less frequent headways midday. Trains run Monday through Friday, but not on weekends or holidays, although they sometimes run other times in conjunction with special events. There are 16 stations on the line, from DeBary on the north to Poinciana on the south. The system has many on-board amenities, including accommodations for luggage, bicycles, wireless internet and restrooms. Stations are designed to be comfortable and secure, but otherwise modest in construction cost. They include platform canopies to provide shade, ticket vending machines to facilitate fare payment, water fountains, emergency phones and closed-circuit cameras.

A technical memorandum, completed in March 2015 for the Polk County TPO, evaluated the possible extension of SunRail passenger rail service into Polk County. The technical memorandum was completed in support of the 2040 Long Range Transportation Plan Update. The memorandum includes the following topics:

- Potential Staging Alternatives
- Conceptual Site Considerations
- Conceptual Feeder Bus Services
- Ridership Propensity Analysis
- Institutional Considerations

Staging Alternatives

Alternatives were considered that allow for a staged expansion of SunRail beginning with feeder bus service and concluding with rail service across central Polk County. There are several alternatives that can be considered for extending SunRail into Polk County. These include interim alternatives to tie into the Phase II southern terminus at Poinciana. A logical staging sequence for the development of a SunRail extension would include:

1. **Phase I: Using express bus service from select park and ride locations in Polk County to the Poinciana station.** Park and ride facilities should be considered for Haines City, Auburndale, Lakeland and possibly Winter Haven. Express bus service from Haines City and Auburndale would be expected to use US 17/92. Express bus service from Lakeland is likely to be more efficient using I-4 for a major portion of the trip. Ideally, park and ride locations should be near potential future rail park and ride stations.
2. **Phase II: An extension of SunRail service to a new station at Haines City, with supporting express bus service from select park and ride locations, including Auburndale, Lakeland and possibly Winter Haven.** This would amount to an approximate 15-mile extension of the SunRail system. A practical advantage of this alternative is that there are typically only five freight trains per day, both presently and well into the future, on this segment of the CSX A-Line. In support of commuter rail, the Haines City Commission has passed a resolution requesting that SunRail consider future expansion to Haines City and requesting FDOT to participate in or undertake necessary planning and environmental studies.
3. **Phase III: A further extension of SunRail service to an additional station at Auburndale, with supportive express bus service from select park and ride locations, including Lakeland.** This would amount to an additional 13-mile extension from Haines City, and 28-miles from Poinciana. This extension also shares the practical advantage that there are only five freight trains per day, on this segment of the CSX A-Line.
4. **Phase IV: Lastly, a potential extension of SunRail service to Lakeland, also with supportive bus services.** Extending service from Auburndale to Lakeland would amount to an additional 11 miles from Auburndale, or a total of 39 miles from Poinciana. Unfortunately, the segment of CSX between Auburndale and Lakeland currently sees 20 freight train movements per day rising to an estimated 27 freight trains in 2030. This activity of freight operations would make this extension substantially more difficult.

The 2009 FDOT Rail Evaluation Study noted that significant capital investments would be required, including new track with passing sidings from Auburndale to Lakeland, track improvements to Poinciana, stations with

platforms and parking, and additional rail vehicles. It also anticipates conflict between existing and future CSX operations and passenger rail on the rail section west of Auburndale.

Compared to year 2030 SunRail ridership estimates of 2,350 for the Poinciana Station, the FDOT Study estimated year 2030 boardings of 2,130 for a SunRail extension from Poinciana to Lakeland, with 673 in Haines City, 500 in Auburndale and 273 in Lakeland. It also estimated 684 boardings from the SunRail Phase I and II stations traveling west and alighting at a Polk County station. Finally, it estimated that 760 of the 2,130 daily trips would be internal to Polk County.

Conceptual Site Considerations

An initial list of potential station locations was provided, using locational criteria such as accessibility to current development and/or major roadways, amenable track geometry, and absence of environmental constraints. This analysis yielded a total of ten potential stations locations:

- Phase II: Ronald Reagan Boulevard, downtown Davenport, Martin Luther King, Jr. Way/Haines City, old train station/Haines City
- Phase III: Lake Alfred, Auburndale Common
- Phase IV: Combee Road, Lake Parker Road, Lakeland Amtrak Station, Lakeland Bus Depot

To identify the best station area in each phase, each potential station location was evaluated based on eleven criteria:

- Rail Operations – track distance, travel time, additional trains required, capital cost
- Potential Ridership – population, employment
- Development Character – block length, municipal land
- Transportation – roadway intersections, bus routes, freight activity

Conceptual site considerations identified potential parking locations, pedestrian and vehicular access and circulation issues, and order-of-magnitude land development possibilities; all of which confirm the site locations as theoretically viable station locations.

From the findings of the eleven criteria, recommended station areas were identified in each of the three rail phases:

- Phase II: Martin Luther King, Jr. Way or Old Station – These two potential station locations lie close to each other and share many of the same pros and cons. Because they are centrally located, job and housing density are higher than in downtown Davenport or Ronald Reagan Boulevard, both now and as estimated in 2040. Both sites benefit from adjacent investment and have further development potential. Drawbacks of these locations include longer distances, longer travel times and larger capital costs than stations closer to Poinciana. Additionally, these station areas are not municipally owned.
- Phase III: Auburndale Common – This potential station is more centrally located than a station in Lake Alfred. This results in higher densities of both population and employment as well as strong development potential. However, because this site is further from Poinciana, it has more road crossings and a higher capital cost than a Lake Alfred station.
- Phase IV: Lakeland Amtrak – The presence of an existing rail station and potential connections between Amtrak and SunRail are very strong benefits of locating the Phase IV station here. It also occupies a fairly centralized location. Unlike the Lakeland Bus Depot, the Lakeland Amtrak Station has a block length that is long enough to ensure a SunRail train can stop without requiring road closures. Additionally, this station shows promise for transit-oriented development as downtown Lakeland expands to the east.

Conceptual Feeder Bus Services

Conceptual feeder bus services were created to support the various staging alternatives. The Phase I staging alternative consists exclusively of bus service connecting Polk County to the Poinciana SunRail station, while Phases II, III and IV include extensions of SunRail service to Haines City, Auburndale and Lakeland, respectively. Express and feeder bus services were envisioned with the following considerations in mind:

- Existing service patterns – Express and feeder services should connect to major transit hubs or major points of overlap in existing or planned service

- Travel time – Express and feeder service must minimize travel times, avoiding circuitous routes or frequent stops
- Equitable access – Particularly for feeder bus services to future Polk County rail stations, connecting transit-dependent populations to the station should be a priority

Phase I Concept

Phase I focused on limited express service to Poinciana. Limited express service serves dual purposes for Polk County; it provides a connection to SunRail service and helps gauge potential ridership in a rail extension. Existing service patterns and travel time were the primary considerations in locating service, but an additional goal was to create a route or series of routes that would attract and provide justification for rail extension.

In order to minimize travel times and waiting times, a single express service for all of Polk County would be ideal. However, any route connecting Lakeland, Auburndale, Winter Haven and Haines City would be time prohibitive, especially for Lakeland commuters. This severely limits the ridership potential of the service. This same issue occurs when trying to serve both Auburndale and Winter Haven. As a result, three separate routes were suggested, with two of them having priority. The first of the high-priority services connects Lakeland to Poinciana, originating at the Lakeland Bus Depot and using I-4 to connect to Poinciana. This Lakeland Connector would likely be a true express service, with no stops between downtown Lakeland and Poinciana, with a likely travel time of approximately 50 minutes. The second high-priority service would connect Auburndale to Poinciana, passing through Lake Alfred and Haines City via US 17, on the way to Poinciana. Stops would be provided at Haines City, with consideration given for stops in Lake Alfred and Davenport if there is evidence for sufficient ridership. Depending on the number of stops, this service would take between 50 and 55 minutes. A third service could originate in Winter Haven at the bus terminal off NW 6th Street, traveling along US 17, and passing through Lake Alfred on the way to the Haines City bus depot off 17th Street before continuing to Poinciana. Because of some of the redundancy with the Auburndale Connector, this route would be beneficial only if there was sufficient ridership from Winter Haven, or if Haines City requires additional service. This route is expected to be approximately 50 minutes from end-to-end.

All routes would operate during peak AM and PM commuting hours only. Given the length of each route, four buses for each route (or 12 buses total) would be necessary to provide 30-minute headways. At 45- or 60-minute headways, as little as two buses each (or 6 buses total) would be sufficient.

Phases II, III and IV Concept

Phase II focused on improving service to downtown Haines City. Projected 2040 population and auto-dependency were added to the list of considerations in locating service, as there is clear benefit in serving locations with high projected populations or high transit-dependent populations with a direct link to SunRail. There are very few gaps in Polk County transit connectivity, and service for Lakeland, Winter Haven, and even Auburndale is robust and well connected to the respective cities' downtowns. Only Haines City provides opportunity for service upgrades. Based on these variables, as many as four new routes have been identified as feeders to Haines City rail service:

- Connection to Winter Haven via S. 1st Street and Lucerne Park Road/SR 544. This route serves a large population base along its route and could have two or more stops. It is expected to be approximately 20 minutes from end-to-end, with additional stops lengthening the trip. One bus could serve the route with 60-minute headways.
- Connection to Lake Wales, via US 27. This route serves a large auto-dependent population in the heart of Lake Wales, as well as larger population centers north of town. The route is expected to take approximately 25 minutes from end-to-end, with a potential midpoint stop at Cypress Gardens Boulevard. One bus could serve the route with 60-70-minute headways.
- Connection to Ronald Reagan Parkway, via US 92 and CR 547. This route serves auto-dependent populations in Davenport, and new population centers closer to the Parkway. The route would take approximately 20 minutes, so one bus could serve the route with a 45-60-minute headway.
- Connection to Lakeland and Auburndale, via US 92. This route would serve population centers in Lakeland and Auburndale, as well as auto-dependent communities, and would easily connect to major

transit hubs in the region. The route would take approximately forty minutes, so two buses could serve the route with forty-five minute to sixty-minute headways.

For Phases III and IV, existing transit routes provide a high degree of coverage that could connect to new SunRail stations. In fact, the Lakeland and Auburndale express bus service would be removed if rail service extends beyond Haines City. Existing Lakeland-to-Auburndale service could be bolstered if enough ridership interest is found.

Ridership Propensity Analysis

This analysis quantified potential ridership in Polk County and used population projections for the year 2040 and current commuting patterns to and from the county's proposed station areas (including a future Orlando International Airport station, which adds opportunities for air travelers and to interregional rail. The ridership propensity analysis found that ridership is likely to be significantly lower than other SunRail stations. A scenario analysis showed that, with changes in market trends and land use policies, higher ridership can be expected, but it would require additional effort on the part of Polk County communities.

Institutional Considerations

The creation of the Central Florida Commuter Rail Commission involved a myriad of institutional issues, as reflected in the collection of legal documents associated with SunRail. As efforts move forward to extend SunRail service into Polk County many, if not all, of the following agreements may need to be amended to reflect an expanded SunRail system with the participation of Polk County:

- Interlocal governance agreements
- Interlocal funding agreements
- Interlocal operating agreements
- Joint station use agreements between local governments and FDOT
- Agreements with local transit agencies
- Full funding grant agreement between FDOT and the Federal Transit Administration
- Applications to the Federal Railroad Administration
- A host of agreements involving the CSX Railroad, FDOT, and the Central Florida Commuter Rail Commission, describing purchase provisions, operating provisions and many other coordination requirements

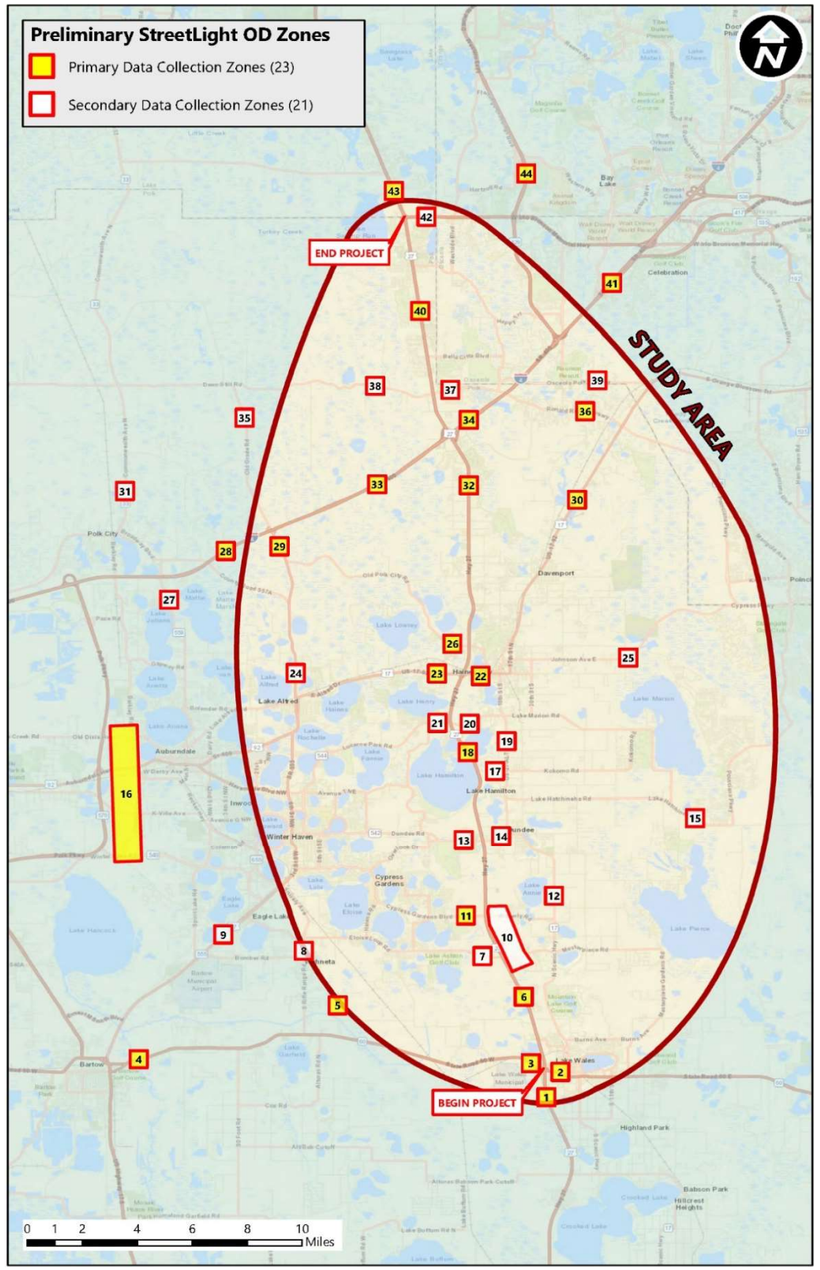
Other Projects

There are other SunRail extension options under consideration. One would be a spur running easterly, beginning just north of the Meadow Wood station and connecting to the intermodal facility at Orlando International Airport. SunRail has already initiated a project development study and has identified the project as part of a potential Phase III of the SunRail system. There is a high degree of physical feasibility for this spur, as it would make use of 3.5 miles of track owned by the City of Orlando and 2.0 miles of new alignment on airport property. This project would significantly enhance connections from Polk County to Orlando International Airport for both passengers and employees. In addition, the spur would tie into the proposed All Aboard Florida/Brightline project, which could potentially provide long distance passenger train options to south Florida. These connections would substantially increase the value of a SunRail extension into Polk County.

3.6 ORIGIN DESTINATION DATA

As a part of this study, Origin-Destination (O-D) data for all vehicular trips on US 27 and other roads within the study area was collected using Streetlight Data. Streetlight is an on-demand mobility analytics platform that utilizes data from mobile devices to conduct analyses like O-D, travel time, and select link studies. This data is used to determine travel patterns of traffic entering and exiting US 27 and/or the study area. Many zones were defined along and near the US 27 corridor to be used for various O-D analyses. The zones are depicted in **Figure 3-5**, and the analysis of the O-D data is summarized in Section 6.1.

FIGURE 3-5: ORIGIN-DESTINATION ZONES



3.7 TRAVEL DEMAND MODEL

3.7.1 Project Model Development

The travel demand model being used for this study is based on the current adopted District One Cost Feasible 2040 Regional Planning Model (D1RPM v1.0.3), with refinements made in conjunction with a May 2018 US 17/92 Haines City traffic study. The D1RPM is a travel demand forecasting tool developed by FDOT District One, with the cooperation of the six District MPO/TPOs in support of their current 2040 Long Range Transportation Plans (LRTP). This model was adopted by the Polk County TPO for use in developing traffic forecasts within the County.

The 2010 base year model validation was refined for the project study area to ensure that the model is replicating base year traffic conditions and counts. The model refinement was performed by Traf-O-Data using the guidelines identified in FDOT *Project Traffic Forecasting Handbook*. Validation criteria including volume over count (v/c) ratios were used to assess the accuracy of the base year model. Additional information relating to the project model development and validation can be found in the March *2019 Traffic Forecast Modeling Technical Memorandum* prepared by Traf-O-Data included in **Appendix G**.

3.7.2 Forecast Model Development

Build alternative forecasts will be conducted using the D1RPM 2040 No-Build Model as a base. The forecast 2040 No-Build model was developed by applying appropriate base year validation refinements to the 2040 LRTP Cost Feasible model network. This included adding the I-4/CR 532 interchange area (Osceola County) network and socioeconomic data and forecast external station volumes. This data was developed by Traf-O-Data in coordination with FDOT District 5 in March 2019, to achieve consistency with the District 5 model (CFRPM) and Osceola County external station forecasts. Based on coordination with the Polk County TPO and Haines City, the 2040 model socioeconomic (SE) data was refined to reflect planned development within the study area which was not included in the original 2040 SE data.

The base 2040 No-Build network was also revised to include the proposed Southport Connector and the Poinciana Parkway extension to I-4 along the eastern boundary of the model. The 2040 No-Build Model also assumes the existing configuration for the US 27 corridor. This 2040 network was also revised to include the proposed Central Polk Parkway (CPP) project, from Polk Parkway to 91 Mine Road, consistent with the associated Florida Turnpike (FTE) project model coding.

3.8 TRUCK AND FREIGHT DATA

The following data sources of truck and freight data was obtained and reviewed to summarize the existing truck volume on the US 27 corridor, and freight commodity information in the study area:

- FDOT 2018 Annual Average Daily Traffic (AADT) Report by FDOT Traffic Information (FTI)
- FDOT 2018 Annual Vehicle Classification Report by FTI
- FDOT 2018 Truck AADT GIS Shapefiles by FTI
- Truck AADT from District One Regional Travel Demand Model (D1RPM)
- Freight Analysis Framework (FAF) Data by Federal Highway Administration (FHWA)
- 2011 TranSearch Data from FDOT Forecasting and Trends Office
- Streetlight Data

3.8.1 FDOT 2018 AADT Report for Truck Traffic

The 2018 AADT Report was obtained from FTO, which is FDOT's web-based mapping application that provides traffic count site locations and traffic count data. The 2018 AADT report includes truck factors for count stations where vehicle classification data was collected. **Table 3-6** presents daily traffic volumes and the report truck factor for 12 count stations on US 27 in the study area. Based on the actual truck counts at these stations, the average percentage of truck traffic for the focused US 27 segment is 9.6%, with a minimum of 6.6% south of SR 530/US 192 and a maximum of 12.3% north of Central Avenue in Lake Wales.

TABLE 3-6: FDOT 2018 AADT REPORT T FACTORS

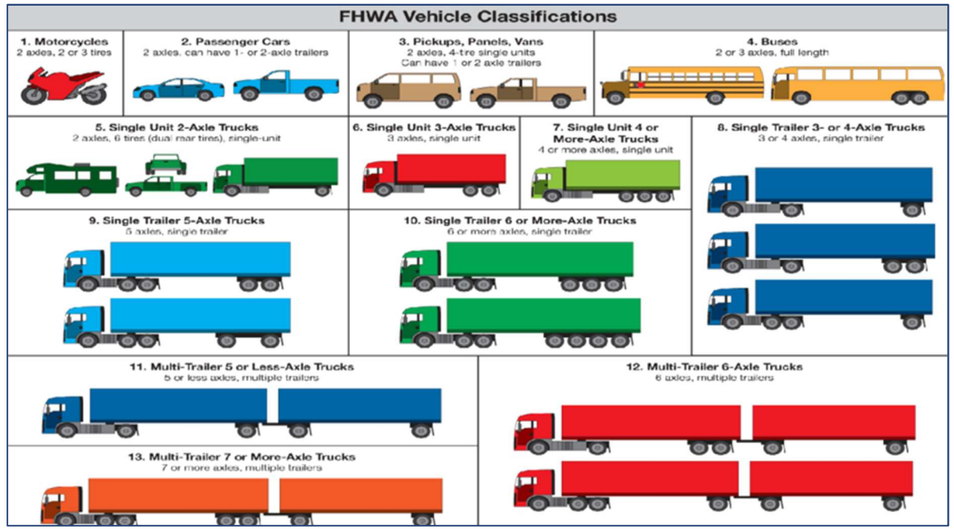
"K" FACTOR: DEPARTMENT ADOPTED STANDARD K FACTOR BEGINING WITH COUNT YEAR 2011
AADT FLAGS: C= COMPUTED
"D/T" FLAGS: A= ACTUAL; F= FACTOR CATG; P= PRIOR YEAR;

The reported truck factors represent the heavy vehicle percentages that comprise all truck categories (class 5-13) and buses (class 4) based on the FHWA vehicle classification scheme.

3.8.2 FDOT 2018 Annual Vehicle Classification Report

The annual vehicle classification report is another product of FTO. The report provides detailed information on annual average vehicle compositions at the sites where classified count data was collected. The vehicle classification system used in the report follows the FHWA's scheme presented in **Figure 3-6**.

FIGURE 3-6: FHWA VEHICLE CLASSIFICATION SCHEME



Classified count data for the US 27 study segment were extracted from the FDOT 2018 annual report and the reports are shown in **Figure 3-7**. For each site, detailed classification and summary of heavy vehicle distributions are reported.

FIGURE 3-7: 2018 ANNUAL VEHICLE CLASSIFICATION DATA FOR US 27

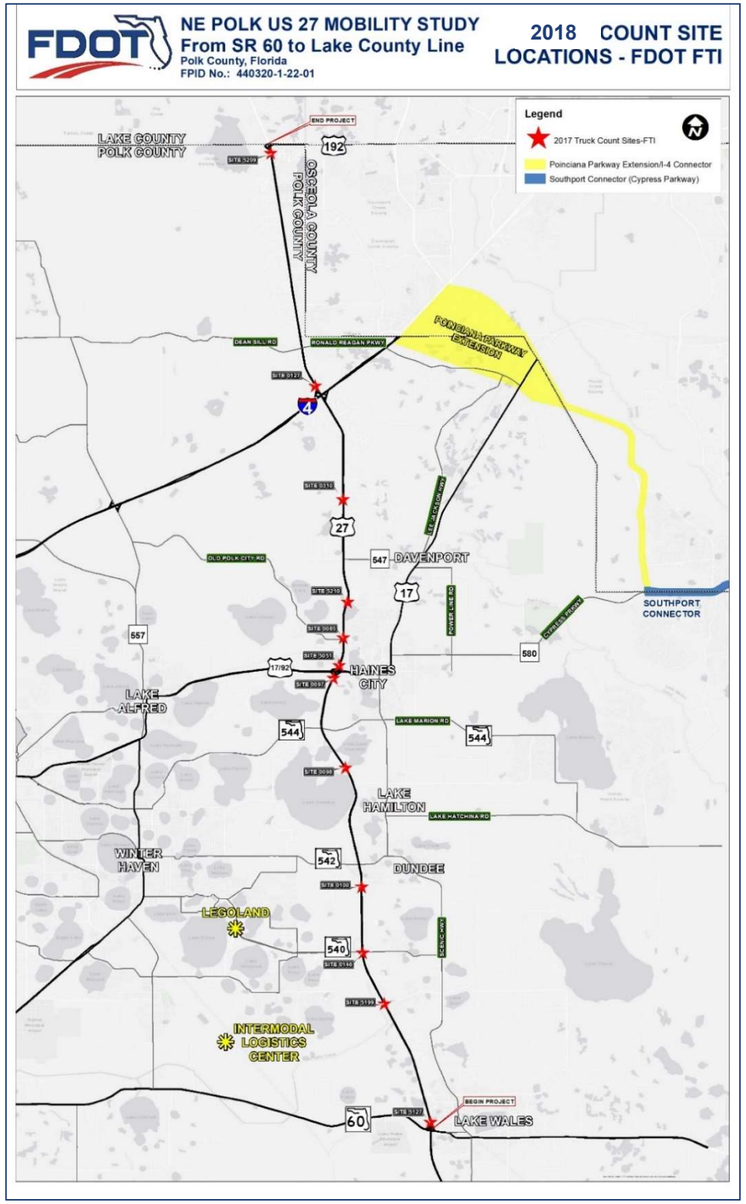
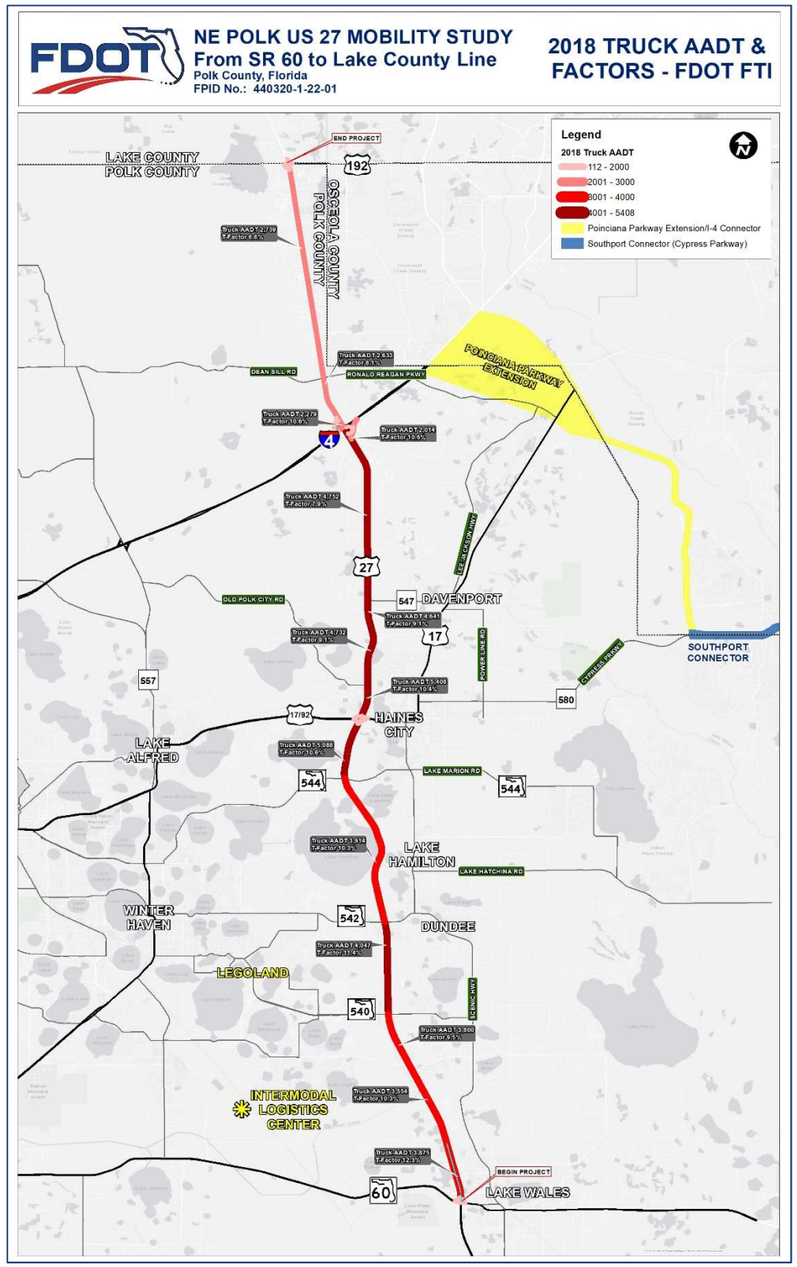
FIGURE 3-8: FDOT 2018 VEHICLE CLASSIFICATION COUNT SITES



3.8.3 FDOT 2018 Truck AADT GIS Shapefiles

Truck AADT GIS shapefiles are among the traffic data provided by FTI. The Truck Volume GIS data provides spatial information for annual average daily heavy vehicle volumes along roadway traffic breaks in the state of Florida. The data is derived from event mapping of traffic characteristics and other information from the FDOT Traffic Characteristics Inventory (TCI) database and is consistent with FTO's AADT and annual vehicle classification reports. **Figure 3-9** depicts extracted truck AADTs on US 27 in the study area.

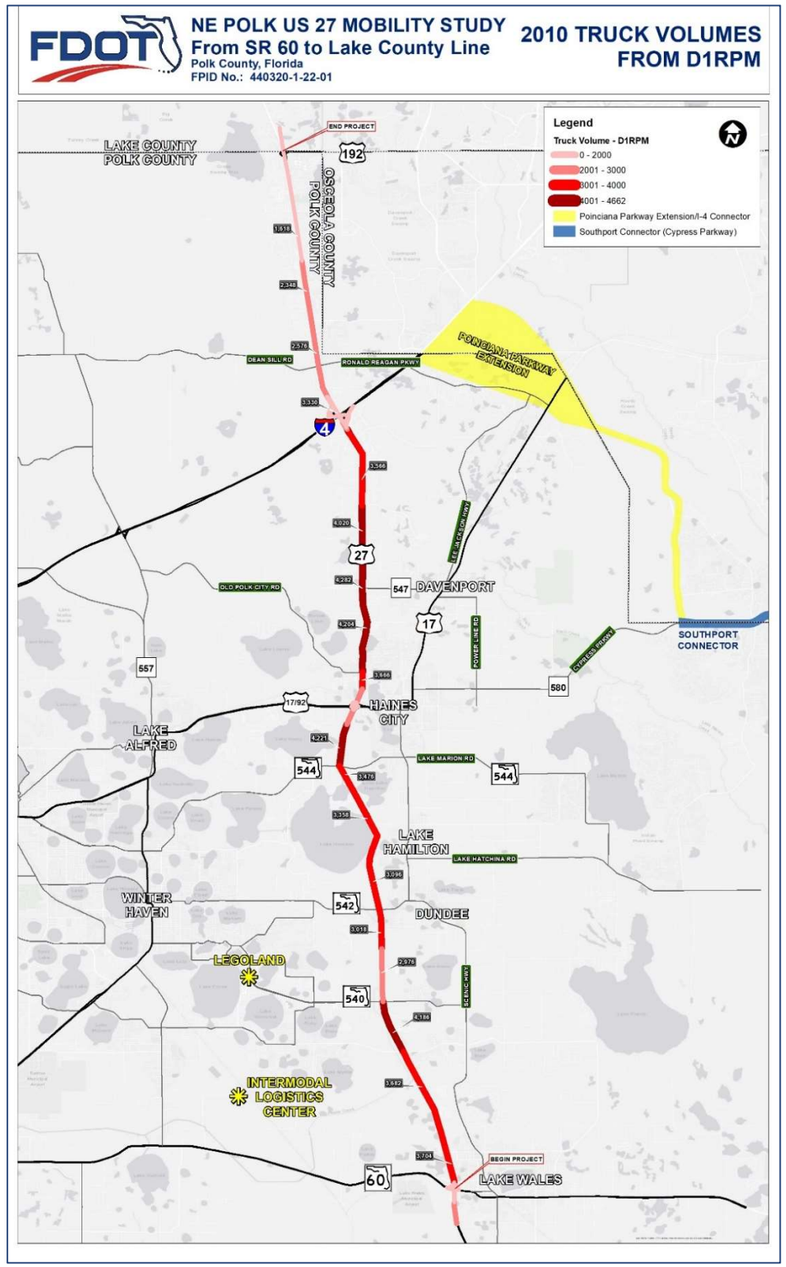
FIGURE 3-9: 2018 TRUCK AADT



3.8.4 D1RPM Truck AADT Estimates

District One's regional travel demand model (D1RPM) is another source for freight traffic data. D1RPM provides both base year (2010) and future year (2040) truck traffic estimates for light, medium and heavy vehicle trucks. The estimation and forecast of heavy vehicle truck traffic in the D1RPM are derived from the Central Office statewide freight model, Freight Supply-Chain Intermodal Model (FreightSIM). A heavy truck Origin-Destination matrix is pre-loaded into the D1RPM from FreightSIM. The volumes of light/medium trucks are estimated in the model and added to the pre-loaded heavy truck trip table and external truck trips to then be assigned to the network. The 2010 base year truck volumes from the latest validated D1RPM for US 27 Study were reviewed and are shown in **Figure 3-10**.

FIGURE 3-10: 2010 TRUCK VOLUMES FROM REGIONAL PLANNING MODEL



The model volumes are typically compared with observed count data for the reasonableness check and validation. D1RPM also provides the forecast truck AADTs for the future year scenario (2040). It can be used as an analysis tool to forecast truck volumes for different types of policy evaluation and planning studies. The model also provides other analytical capabilities such as select link analysis tool to explore different attributes of truck traffic on the US 27 corridor. However, the dependency of the model on FreightSIM for heavy truck estimation is a shortcoming of D1RPM that limits the users' ability to utilize the model for a wider range of analyses. Since the heavy truck trip table is fixed and pre-loaded to the model from FreightSIM, regional changes in heavy truck traffic for many planning studies cannot be captured in D1RPM.

3.8.5 FHWA's Freight Analysis Framework (FAF)

The Freight Analysis Framework dataset is a publicly available product that is developed jointly by the Federal Highway Administration (FHWA) and Bureau of Transportation Statistics (BTS). The latest version, FAF4, with 2012 base year data was updated in 2017 with provisional estimates of commodity flows, network and truck assignments, and regional forecasts from 2020 to 2045. FAF4 is an integrated multimodal data from a variety of freight data sources including the 2012 Commodity Flow Survey (CFS) and international trade data from the Census Bureau. It incorporates commodity flow data from manufacturing, wholesale trade, agriculture, extraction, utility, construction, transportation, service, and other industry sectors to present a comprehensive picture of multimodal freight movement among states and major metropolitan areas. The data include annual commodity flows (quantity, dollar volume, and ton-mile) between FAF origin and destination zones by commodity type for truck, rail, water, air, pipeline, and multiple & mail modes. Due to the coarse zoning system, FAF is best suited for multimodal inter-state or multi-state analysis.

The commodity flows in ton and monetary value are the main products of the FAF data. In addition, FAF estimates multimodal freight flow and assigns commercial truck traffic to a national transportation network. **Figure 3-11** shows 2012 annual commodity flow on US 27 in the study limits and **Figure 3-12** presents estimated 2012 truck traffic.

FIGURE 3-11: 2012 COMMODITY FLOW DATA ON US 27

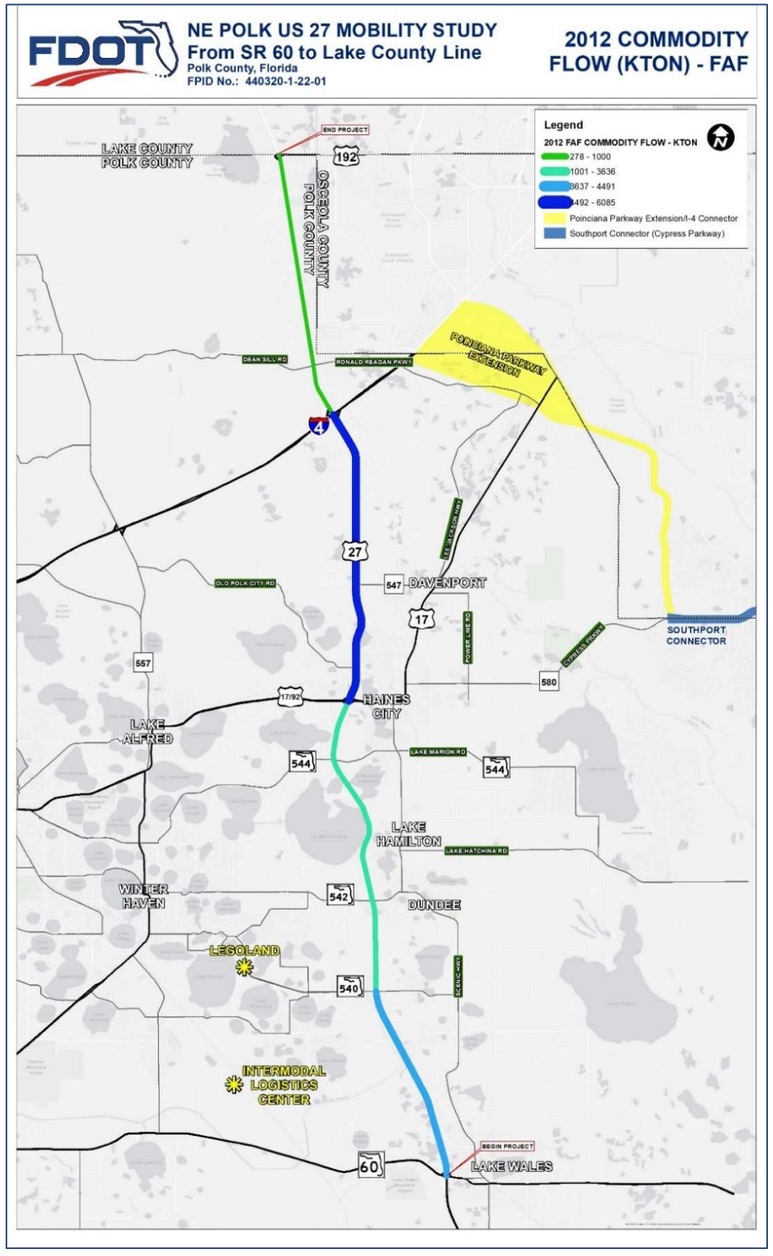


FIGURE 3-12: 2012 FREIGHT ANALYSIS FRAMEWORK TRUCK AADT

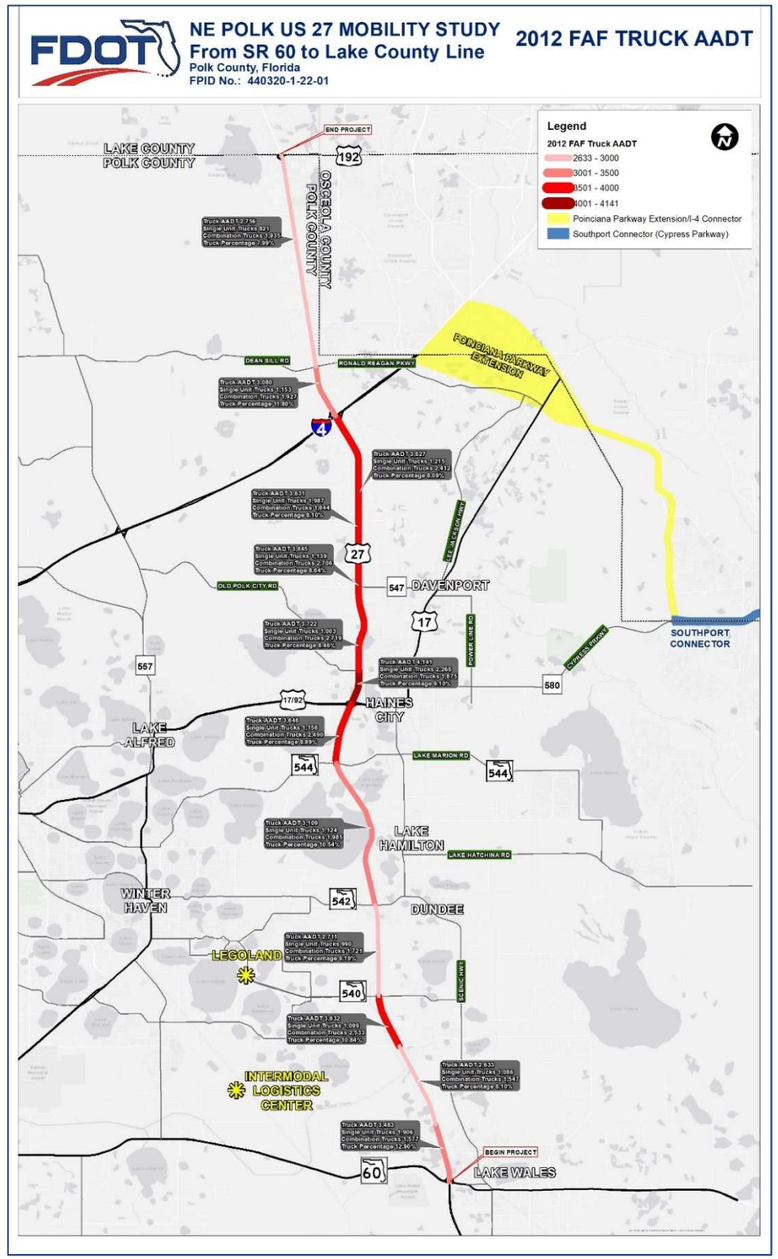

3.8.6 TranSearch Data

Similar to FAF data, TRANSEARCH is a multimodal proprietary commodity flow dataset that is developed with the goal of capturing commodity shipments generated by various industry sectors. However, while the FAF data relies primarily on the US Census Commodity Flow Survey of major freight-related industries, the TRANSEARCH has been mainly developed by using economic Input-Output (I/O) models that estimate the amount of each commodity that is produced and consumed in each U.S. County. TRANSEARCH development is also supplemented by trade association and industry reports, U.S. government-collected data and other data from truck carriers, public sources, and other propriety sources.

FDOT owns the 2011 TRANSEARCH data and its forecasts for 2015, 2020, 2025, 2030, 2035 and 2040. The data provides multimodal freight flow information at county level. The 2011 freight facts for the US 27 corridor were extracted and summarized below.

A significant amount of freight is hauled on the US 27 corridor. On average, 5,436,094 tons of freight is transported on the US 27 corridor in the study area which translates to $5.617 billion of goods. This equals an average of 378,883 annual truckloads passing through this corridor. Based on the Standard Transportation Commodity Code (STCC) classification codes, there were 429 types of commodities hauled on the study section of US 27. **Table 3-7** shows the top 10 commodities by tonnage transported on this section of US 27 which comprise 81% of total freight tonnage hauled on this corridor.

TABLE 3-7: 2011 TOP 10 COMMODITIES BY TONNAGE ON US 27

STCC Commodity Code	Description	Average Annual Tonnage Hauled	
01 21	Citrus Fruits	2,650,324	49%
50 1	Warehouse & Distribution Center	700,941	13%
20 85	Distilled or Blended Liquors	232,480	4%
20 26	Processed Milk	206,983	4%
20 42	Prepared or Canned Feed	132,165	2%
01 39	Misc. Fresh Vegetables	131,432	2%
01 42	Dairy Farm Products	110,444	2%
20 62	Sugar, Refined, Cane or Beet	91,510	2%
32 71	Concrete Products	75,176	1%
20 33	Canned Fruits, vegetables, Etc.	73,053	1%

The number one commodity transported along the study section of the US 27 corridor is citrus fruits, which accounts for 49% of the corridor's total annual freight tonnage. The freight flow from warehouses and distribution centers is the second highest commodity by tonnage (13%), which represents mixed commodity flows from combined shipments that are usually moved to retail locations.

As the table shows, a significant amount of the transported commodities are perishable food products which require special truck equipment and a shorter delivery window. The amount of secondary freight and manufactured products from warehouses and distribution centers on US 27 is also considerable. These commodities are usually considered higher value freight. These types of commodities show the importance of US 27 as a freight corridor for the region.

TranSearch provides information on intermodal freight flows including rail intermodal drayage and air cargo drayage by commodity type and by origin-destination. For example, an average of 13,867 tons of intermodal rail freight drayage have been transported on this section of US 27. The origin-destination information can also be extracted from the data for the freight flows on the corridor. For example, the highest volume of freight tonnage on this corridor is originating from Lee County and going to Orange County which comprises 4% of total annual freight tonnage on the corridor.

3.8.7 StreetLight Data for Commercial Vehicles

The following figures depict Origin-Destination (O-D) data for commercial vehicles in the study area. The data was limited to commercial vehicles by utilizing Global Positioning System (GPS) data rather than Location Based Services (LBS) O-D data (see *Section 6.1 for more information*). **Figure 3-13** depicts the proportional destinations of trips originating from the Central Florida Intermodal Logistics Center (ILC), located in Winter Haven. The Central Florida ILC, which opened in 2014, is a centralized hub for transportation, logistics and distribution serving Orlando, Tampa and other regional Florida markets. It provides rail, intermodal and rail-to-truck transload services.

According to an analysis of the commercial vehicle O-D data obtained through Streetlight, approximately a quarter of the commercial vehicle (truck) trips originating at the ILC proceed west on SR 60. Another quarter proceed west and then north on Rifle Range Road (CR 655), and the remaining trips proceed east on SR 60, the majority of which then head north on US 27.

Figure 3-14 depicts the O-D data for commercial trips originating on US 27 south of SR 60 that continue through the study area. Nearly 15% of trips proceed east on I-4; nearly 7% continue north on US 27; only 1% of trips proceed west on I-4.

Figure 3-15 depicts the O-D data for commercial trips originating on US 27 north of US 192. Nearly 28% of trips proceed east on US 192; nearly 12% proceed west on I-4; just over 6% continue along US 27 past SR 60; only 2% proceed east on I-4.

FIGURE 3-13: INTERMODAL LOGISTICS CENTER COMMERCIAL VEHICLE ORIGIN-DESTINATION MAP

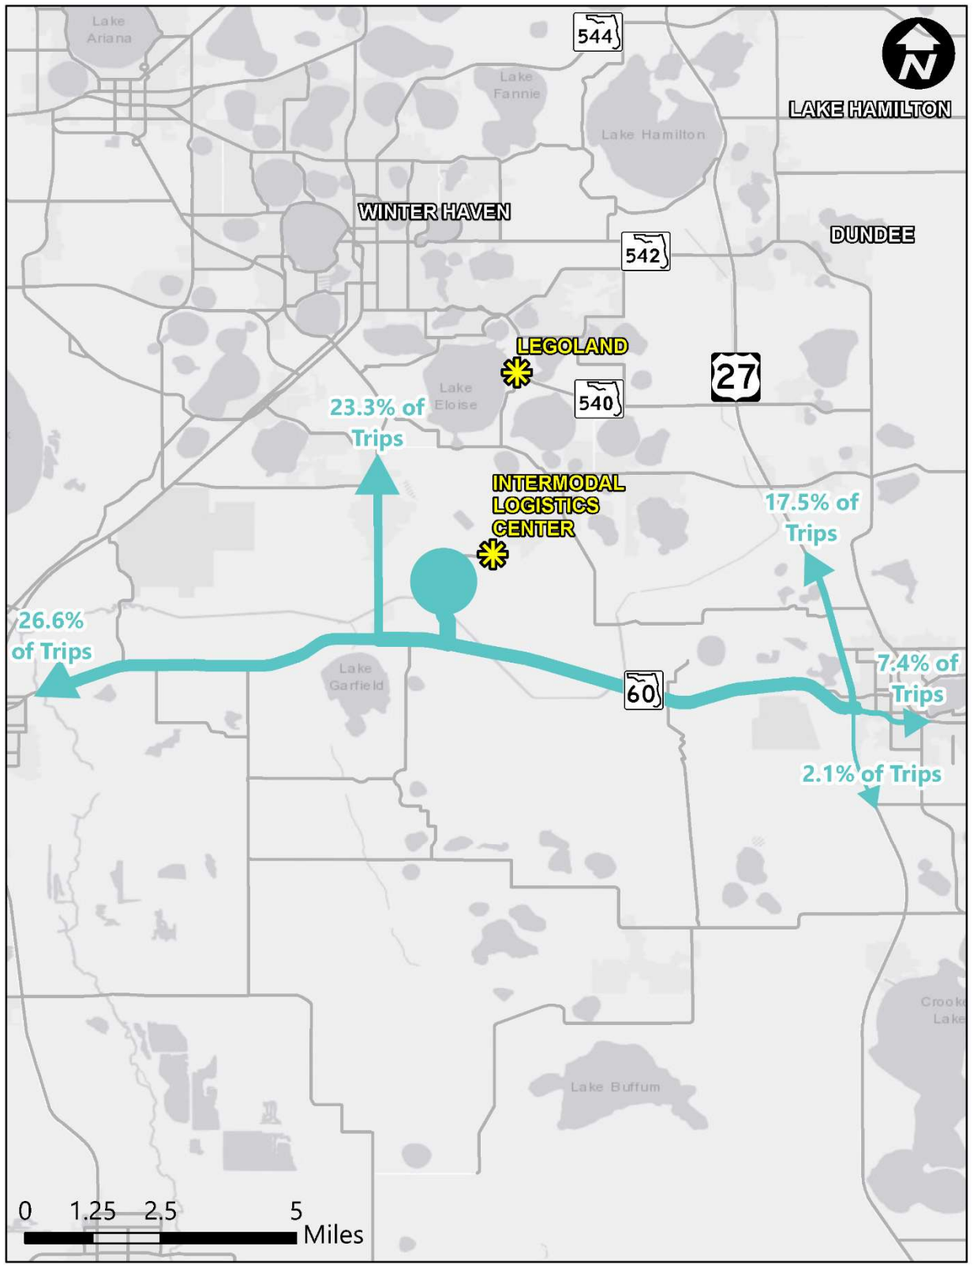

FIGURE 3-14: NORTHBOUND US 27 COMMERCIAL VEHICLE PASS-THROUGH (DAILY) MAP

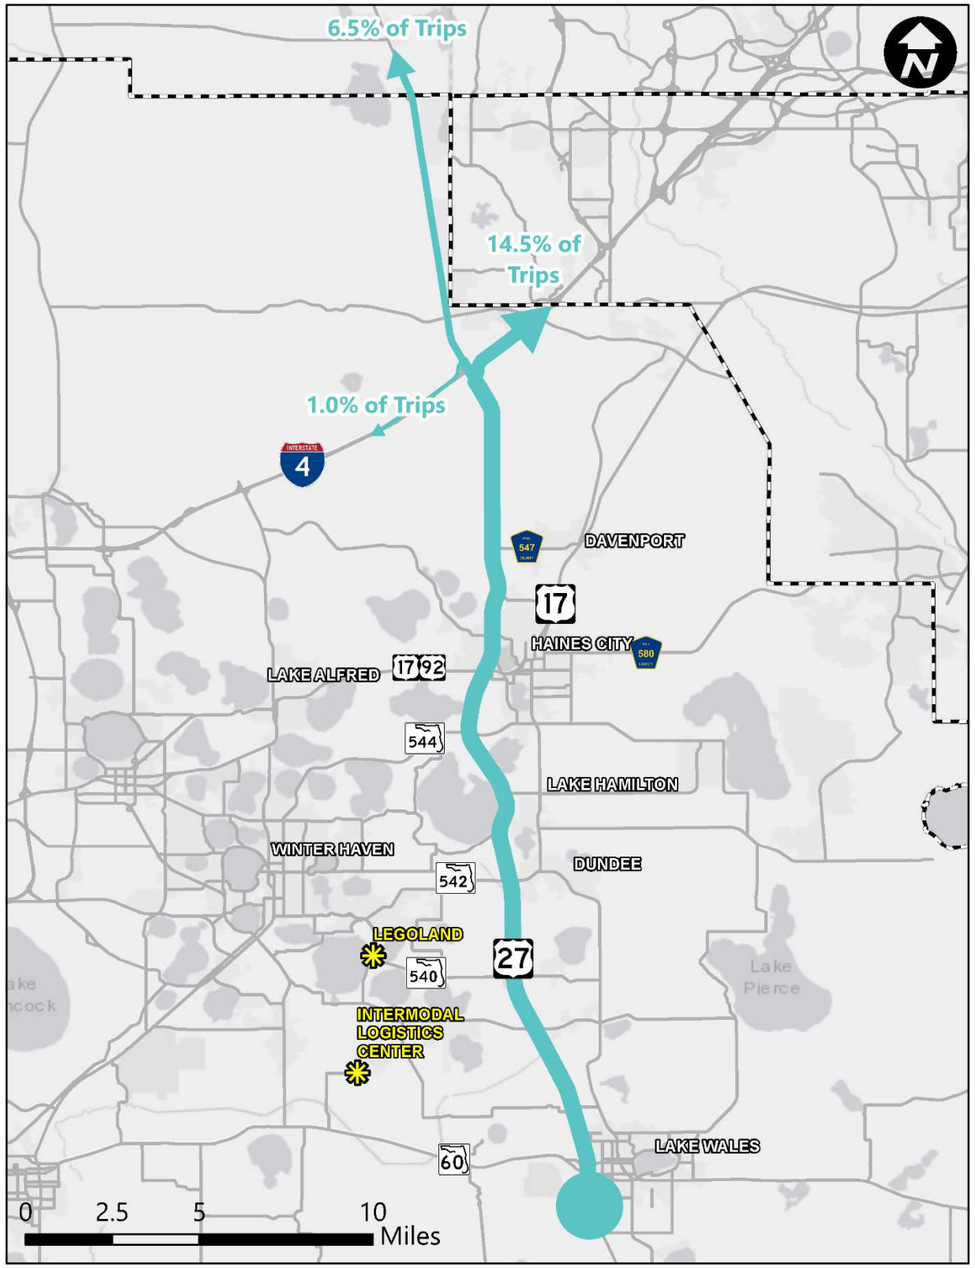

FIGURE 3-15: SOUTHBOUND US 27 COMMERCIAL VEHICLE PASS-THROUGH (DAILY) MAP

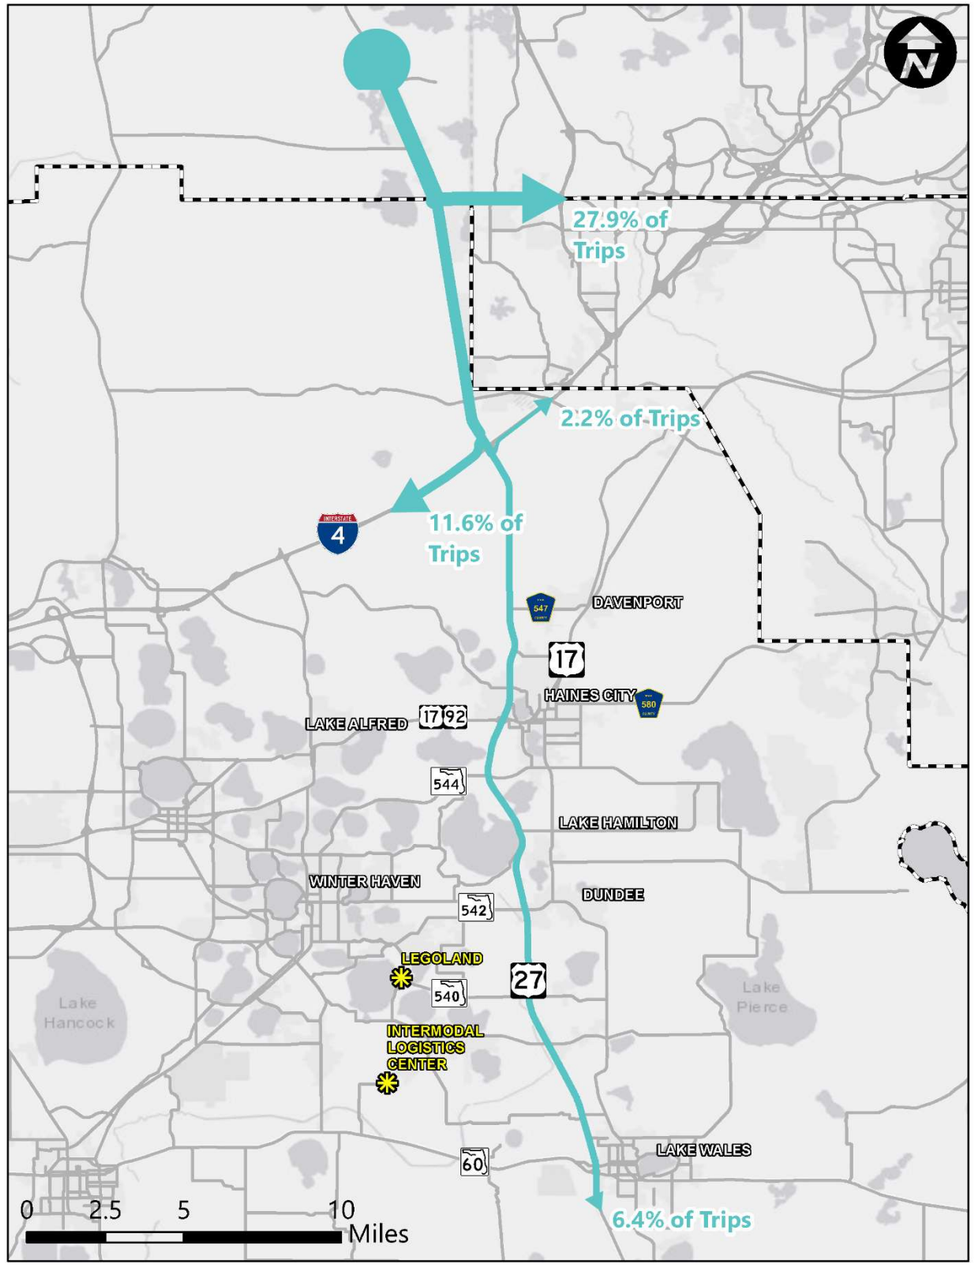

3.8.8 Summary of Findings

A summary of reviewed freight data is presented in **Table 3-8**. While some of these data sources only provide freight vehicle trip information others such as FAF and Transearch provide commodity flow information and convert those into vehicle trips. Geographical resolution of these data sources varies from aggregate FAF zones in FAF data to highway network in StreetLight data. Origin-Destination information is provided in all commodity-based data and can be extracted from D1RPM truck tables and StreetLight data. Commodity based data provide multimodal traffic data and commodity/freight information such as commodity type, weight and value.

Although the reviewed data sources are for different base years, they are comparable with respect to truck flows on US 27. All data sources show a significant percentage of truck traffic on the US 27 corridor (around 10%), which is significant considering an average AADT of 43,000 on the corridor. Moreover, the commodity-based data sources show a high tonnage of commodities are transported on this corridor. These are mostly perishable food products or manufactured secondary freight that are usually time sensitive or more valuable. The freight traffic and commodity data, as well as the central location of the US 27 corridor, underline the importance of it as a major freight corridor for the region.

TABLE 3-8: FREIGHT DATA COMPARISON

4 LAND USE DATA

4.1 LAND USE AND DEVELOPMENT PLANS

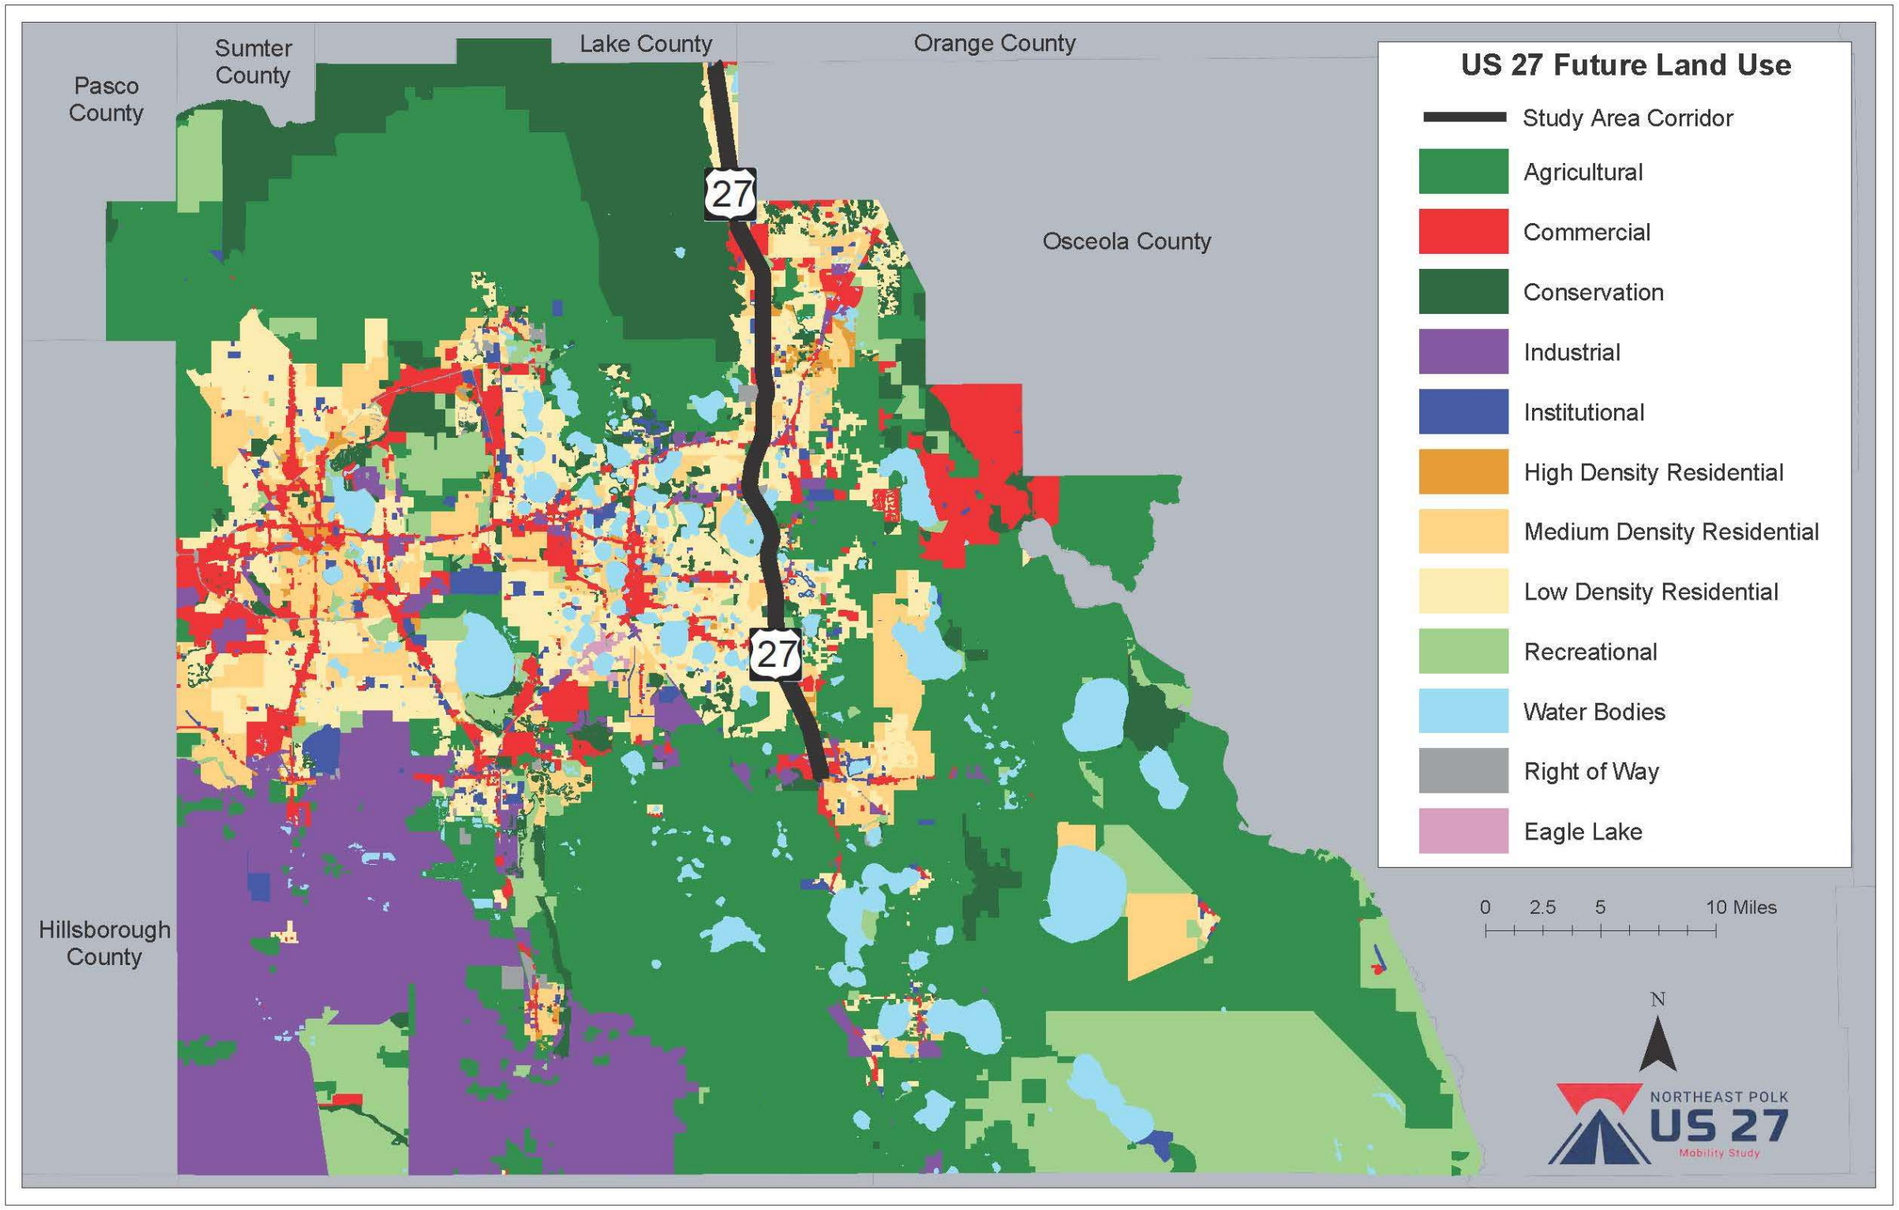
This section documents the current future land use plans of Polk County and the municipal governments within the corridor, as well as the 2045 population and employment forecast currently being developed by the Polk TPO.

4.1.1 Future Land Use Plans

Polk County and each of the municipalities have developed and amended future land use plans for their communities pursuant to state requirements for local governments. These future land use plans are used to guide allowable land uses and serve as a guide for future development activity for an area. **Figure 4-1** illustrates the Future Land Use categories documented in the local Comprehensive Plans.

Generally, the broader study area is surrounded by agricultural and conservation lands. Low and medium density residential development is located along both sides of US 27 between SR 60 and US 192, along with some small areas for institutional, industrial and commercial use. Commercial land uses are primarily situated near SR 60, US 17/92, and I-4. There are multiple large water bodies also located within the study area.

FIGURE 4-1: US 27 FUTURE LAND USE



4.2 DEVELOPMENTS OF REGIONAL IMPACT (DRI)

Pursuant to Section 380.06(1), Florida Statutes, a development of regional impact is defined as "any development which, because of its character, magnitude, or location, would have a substantial effect upon the health, safety or welfare of citizens of more than one county." A development of regional impact is determined, in part, based on the size of the development. Numerical thresholds for different types of development are identified in Section 380.0651, Florida Statutes, and Rule 28-24, Florida Administrative Code. The determination of whether the project was a development of regional impact was based on the size of the project and on whether the development would significantly impact state and regional resources and facilities.

In 2018, statutory provisions related to developments of regional impact (DRI) were amended to eliminate the review process regarding changes to existing DRIs. This change is in addition to statutory changes in 2015 and 2016 that effectively eliminated the DRI review process for new proposed developments that exceed the DRI thresholds and are not exempt from review. Amendments to development orders for existing DRIs are now considered by the local governments that issued the development orders, pursuant to their local development review procedures.

Many times, DRIs are such large regional development projects, that they take many years to fully develop. Their development rights continue long into the future. When forecasting future growth and when evaluating potential concepts, it is important to note where DRI's are located as there may be additional development expected in the future (if they have not yet fully developed), and where they have direct access to US 27. Due to its location, the most critical DRI that could have direct impacts to the corridor alternatives, is the Victor Posner City Center located near the US 27 and I-4 interchange.

According to Polk County GIS data, the DRIs listed in **Table 4-1** are located within the project study area.

TABLE 4-1: DEVELOPMENTS OF REGIONAL IMPACT

DRI	Project No.	Residential	Commercial	Other
Championsgate	1998-001		426,000 GSF retail	4,136 rooms hotel
Clear Springs Mine	1987-026			6,143 ac. mining
Four Corners*	2006-001		1,170,000 GSF retail	
Oak Hill Estates (Providence)	1999-031			2,215 ac. multi-use
Polk Commerce Center	1997-017	11,123 du	6,710,941 GSF retail	
Ridgewood Lakes*	1985-042	5,971 du	381,388 GSF retail

Stoneybrook South*	2004-004	3,654 du		
Victor Posner City Center*	1986-042			366 ac. multi-use

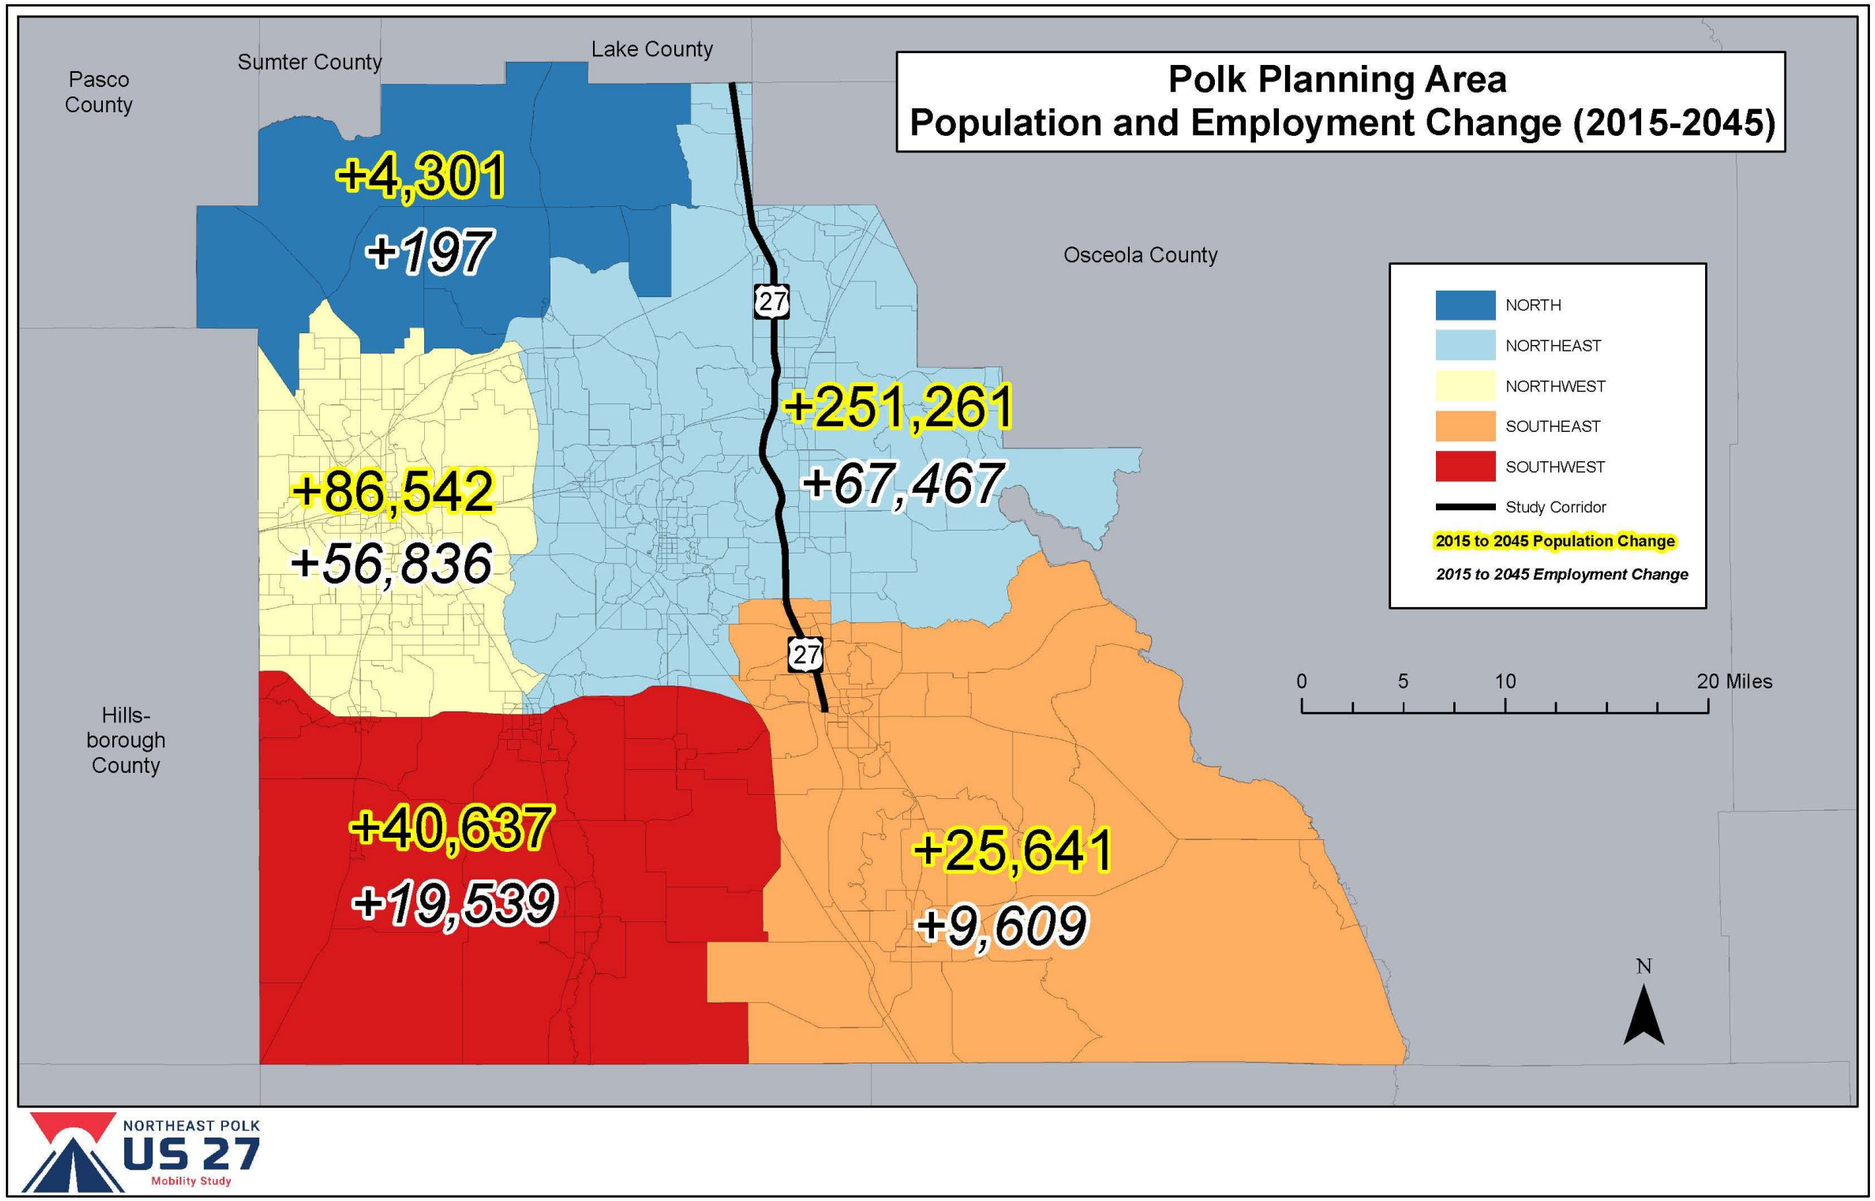
Note: * indicates DRI with direct access to US 27

4.3 POPULATION AND EMPLOYMENT

The 2040 population and employment forecasts used for the travel demand modeling for this project were completed by the Polk Transportation Planning Organization in April 2015. Since that time, Polk County has experienced significant population and associated employment growth. Population growth in the County exceeded 20,000 persons in 2018 alone. A significant share of the population growth is taking place in northeast Polk County.

The Polk TPO developed their 2045 population and employment forecast concurrent with the NE Polk US 27 Mobility Study. Consistent with the 2040 forecast, the 2045 forecast places significant population and employee growth in northeast Polk County as illustrated in **Figure 4-2**. This shows that the County is expecting to add over 250,000 people between 2015 and 2045. Likewise, employment growth is expected to increase in northeast Polk County by over 67,000 employees between 2015 and 2045.

FIGURE 4-2: POLK COUNTY POPULATION AND EMPLOYMENT CHANGE (2015-2045)



Tables **4-2** and **4-3** summarize the population and employment growth in Polk County by Planning Area.

TABLE 4-2: POLK COUNTY POPULATION GROWTH (2015-2045)

Area	Total Population			
	2015	2045	2015-> 2045 Growth	Average Annual Increase (%)
North PA	11,984	16,285	4,301	1.20%
Northeast PA	280,386	531,647	251,261	2.99%
Northwest PA	249,329	335,871	86,542	1.16%
Southeast PA	58,683	84,324	25,641	1.46%
Southwest PA	29,637	70,274	40,637	4.57%
Polk County	*630,019*	*1,038,401*	*408,382*	

TABLE 4-3: POLK COUNTY EMPLOYMENT GROWTH (2015-2045)

Area	Total Employment			
	2015	2045	2015-> 2045 Growth	Average Annual Increase (%)
North PA	817	1,014	197	0.80%
Northeast PA	67,710	135,177	67,467	3.32%
Northwest PA	100,221	157,057	56,836	1.89%
Southeast PA	14,787	24,396	9,609	2.17%
Southwest PA	11,720	31,259	19,539	5.56%
Polk County	*195,255*	*348,903*	*153,648*	

The 2045 population and employment forecast was developed at a traffic analysis zone level. **Figure 4-3** illustrates the forecasted growth in population by TAZ in the study area. **Figure 4-4** illustrates the forecasted employment growth by TAZ in the study area.

FIGURE 4-3: POLK COUNTY POPULATION GROWTH BY TAZ (2015-2045)

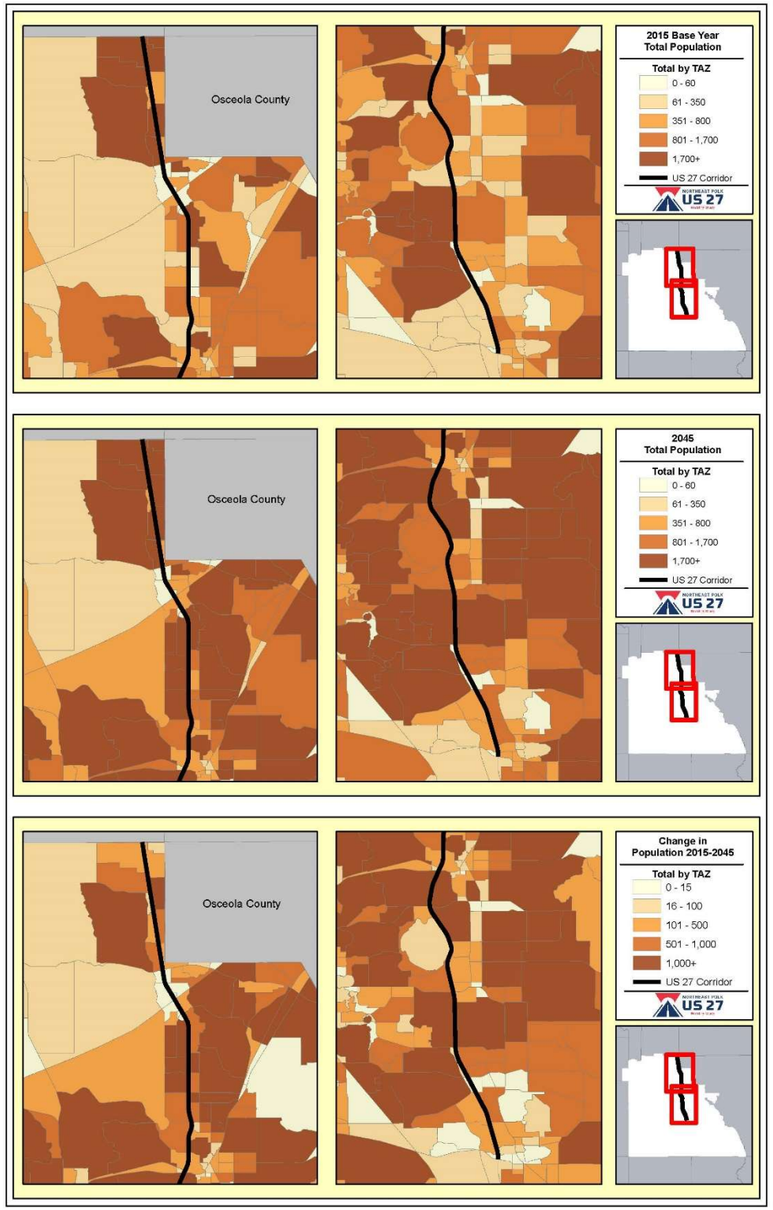


FIGURE 4-4: POLK COUNTY EMPLOYMENT GROWTH BY TAZ (2015-2045)

4.4 FREIGHT ATTRACTORS AND GENERATORS

Freight attractors and generators were identified in the study area using information available from the FDOT District One *Freight Mobility and Trade Plan*, dated 2016, the FDOT District One *Districtwide Freight Activity Center Connector Definition and Evaluation* study completed in 2019, and ongoing FDOT Central Office Advanced Geospatial Analytics project to identify freight activity areas in Florida. The information was obtained from the FDOT District One Freight Coordinator, FDOT Freight Moves Florida website[1], and Central Office freight database maintained by Transportation Data and Analytics Office.

4.4.1 District One Freight Mobility and Trade Plan

The District One *Freight Mobility and Trade Plan* (FMTP) presents an overview of unique freight and logistics characteristics of places within the District including:

- Freight related land uses such as: agricultural (by commodity type), and
- Designated intermodal logistics centers and freight activity centers.

Information from the plan related to US 27 between SR 60 and US-192, including the regional study area surrounding the study corridor, is summarized below.

Land Uses

According to the District One FMTP, citrus is one of the major commodities produced, processed and transported in District One. Ninety percent of citrus is processed into juice in eight processing plants in the District. Polk County is home to five citrus processing plants. Three of these plants: Florida's Natural Growers, Dundee Citrus Growers Association and Haines City Citrus Growers Association, are all either adjacent to US 27 or located within approximately 2 miles from US 27. Mining products, cattle, sugar, vegetables and other fruits are other major products that are produced in District One and transported on US 27.

The centrality of Polk County between three of the largest metropolitan regions in the State of Florida (Orlando-Tampa-Miami), has made Polk County a prime location for manufacturing, warehouse, distribution center, and 3rd party logistics industry establishments. The City of Lakeland is a major freight hub in Polk County with a high density of manufacturing establishments, warehouses and distribution centers that contributes significantly to freight movements on US 27 in the study area. US 27 is the most significant non-interstate freight corridor in District One.

Intermodal Logistics Centers (ILCs) and Freight Activity Centers (FACs)

The District's primary ILC, the Central Florida ILC, is located in Polk County approximately 5 miles west of US 27 and 1.6 miles north of SR 60 off of Logistics Parkway. It is a 318-Acre Intermodal Terminal that serves as a logistics hub for Central Florida including Tampa, Orlando and Miami Metro areas. It also services many other metro regions across the U.S. including Atlanta, New York, Washington D.C., Boston, Chicago, Detroit, Philadelphia, San Francisco, Cleveland and Los Angeles.

The FTMP identified sixteen Freight Activity Centers (FACs) in Polk County with many located near US 27. However, the FMTP does not provide further details regarding the FACs. Therefore, the more recent *Districtwide Freight Activity Center Connector Definition and Evaluation* study was relied upon to identify the FACs within the study area. This information is summarized in the next section.

4.4.2 Freight Activity Center Connector Definition and Evaluation Study

FDOT District One recently completed the *Districtwide Freight Activity Center Connector Definition and Evaluation* study that evaluated Freight Activity Centers (FACs) and their connectors. The study included an evaluation of land use data to identify FACs within FDOT District One, using Department of Revenue (DOR) land use codes and information. The areas with high existing industrial square footage and potential industrial development were explored to identify the following as stated in the evaluation study:

[1] https://freightmovesflorida.com/local-regional-initiatives/dfc-interactive-map/district-1/

- *"FAC's with the greatest building area with DOR land use codes indicating existing industrial and related land uses; and*
- *FAC's with the greatest land area with DOR land use codes indicating developed industrial and related land area and vacant industrial and related land area."*[2]

From the evaluation study, twenty-one FACs were identified in Polk County from which ten (10) are located near US 27 in the study area (within 5 miles of the US 27 corridor). **Figure 4-5** shows the location of the FACs in the study area. These FACs are considered major freight trip generators and attractors as they comprise major freight generator businesses such as manufacturing, warehouses, distribution centers, and transportation and 3PL business establishments. They are identified and categorized based on the industrial building square footage.

The study also identifies and evaluates the connector roads that provide access to the ten FACs and the Freight Mobility Corridors in District One. **Figure 4-6** shows how the FACs are connected to US 27 through identified FAC connectors, distribution routes and other regional facilities.

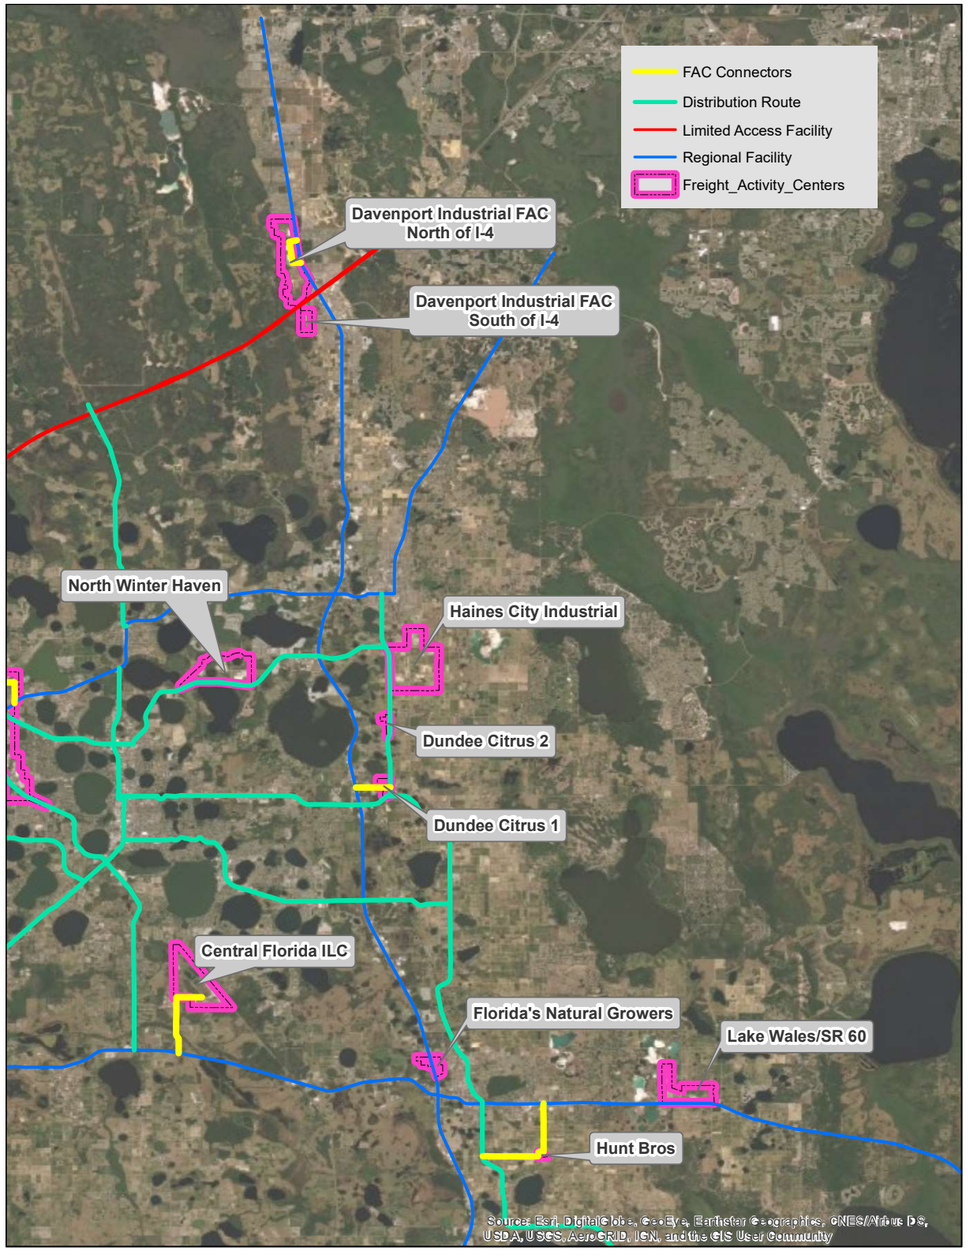
FIGURE 4-6: FAC CONNECTORS



4.5 COMMUNITY PROFILES

Primarily rural in landscape, Polk County supports a growing population that is less diverse than that of the State, with fewer working age adults. When evaluated by age, the fastest growth in the county is for residents age 65 and over. Approximately 77 percent of residents live within either the Lakeland or Winter Haven urbanized areas. The fastest growing areas in the county since 2010 generally occur north of SR 60 and south of I-4 with additional pockets of growth focused just north of Lakeland and along US 27. For municipalities in this area, census data confirms robust growth in population as follows in **Table 4-4**.

TABLE 4-4: MUNICIPALITY POPULATION GROWTH (2010 TO 2016)

Municipality	Population (2010)	Population (2016)	Percent Growth
Auburndale	13,507	15,540	15.1%
Davenport	2,888	3,982	37.9%
Dundee	3,717	4,209	13.2%
Haines City	20,535	23,454	14.2%
Lake Alfred	5,015	5,766	15.0%
Lake Hamilton	1,231	1,382	12.3%
Lake Wales	14,225	15,860	11.5%

Polk County hosts over a quarter million jobs. Employment is distributed across a range of sectors, with health care and retail serving as the primary employers. Most employment is focused near Lakeland and Winter Haven with a large employment center also located in Bartow. Smaller but numerous areas of employment are focused along major roadway corridors including US 27 and SR 60.

Unlike employment, workers are more evenly distributed across the county, but still focused in the Lakeland and Winter Haven urbanized areas and along US 27. The highest poverty rates within the county are found within the municipalities, but a large portion of the population south of SR 60 lives below the poverty level.

Figures 4-7 through **4-12** show the socioeconomic information geographically for the study area, which can be generally summarized as follows:

Figure 4-7: Zero Car Ownership shows areas without access to personal vehicles; these areas are considered transportation disadvantaged and more dependent on public transportation.

Figure 4-8: Population Age 55 and Above shows areas with greater populations of older citizens, who often are disabled or have other health restrictions; these areas are also considered transportation disadvantaged and more dependent on public transportation.

Figure 4-9: Environmental Justice Planning Areas identifies areas with low-income and minority populations; these areas often need better protection from environmental and health hazards, greater community involvement and fair access to decision-making policies.

Figure 4-10: Median Household Income and **Figure 4-11: Persons Above Poverty** show the distribution of personal income; households and persons with lower incomes are often more reliant on public transportation to get to jobs and access goods and services.

Figure 4-12: Racial and Ethnic Dispersion shows locations of predominant minority populations; these segments of the community are often found in rural areas that are more dependent on public transportation.

4.6 COMMUNITY CHARACTERISTICS AND CONTEXT CLASSIFICATIONS

The FDOT context classification system describes the land use, development, and transportation network functionality along a travel corridor. This provides the basis for a qualitative analysis of the general character of the area as part of the FDOT planning process. Recording the existing and future anticipated context classification of a corridor supports the appropriateness of future development of transportation to best provide safe and efficient improvements.

In August 2017, FDOT published the Completing Florida's Streets document, which provides the standards for context classification. **Figure 4-13** illustrates each of the designated classifications by general character.

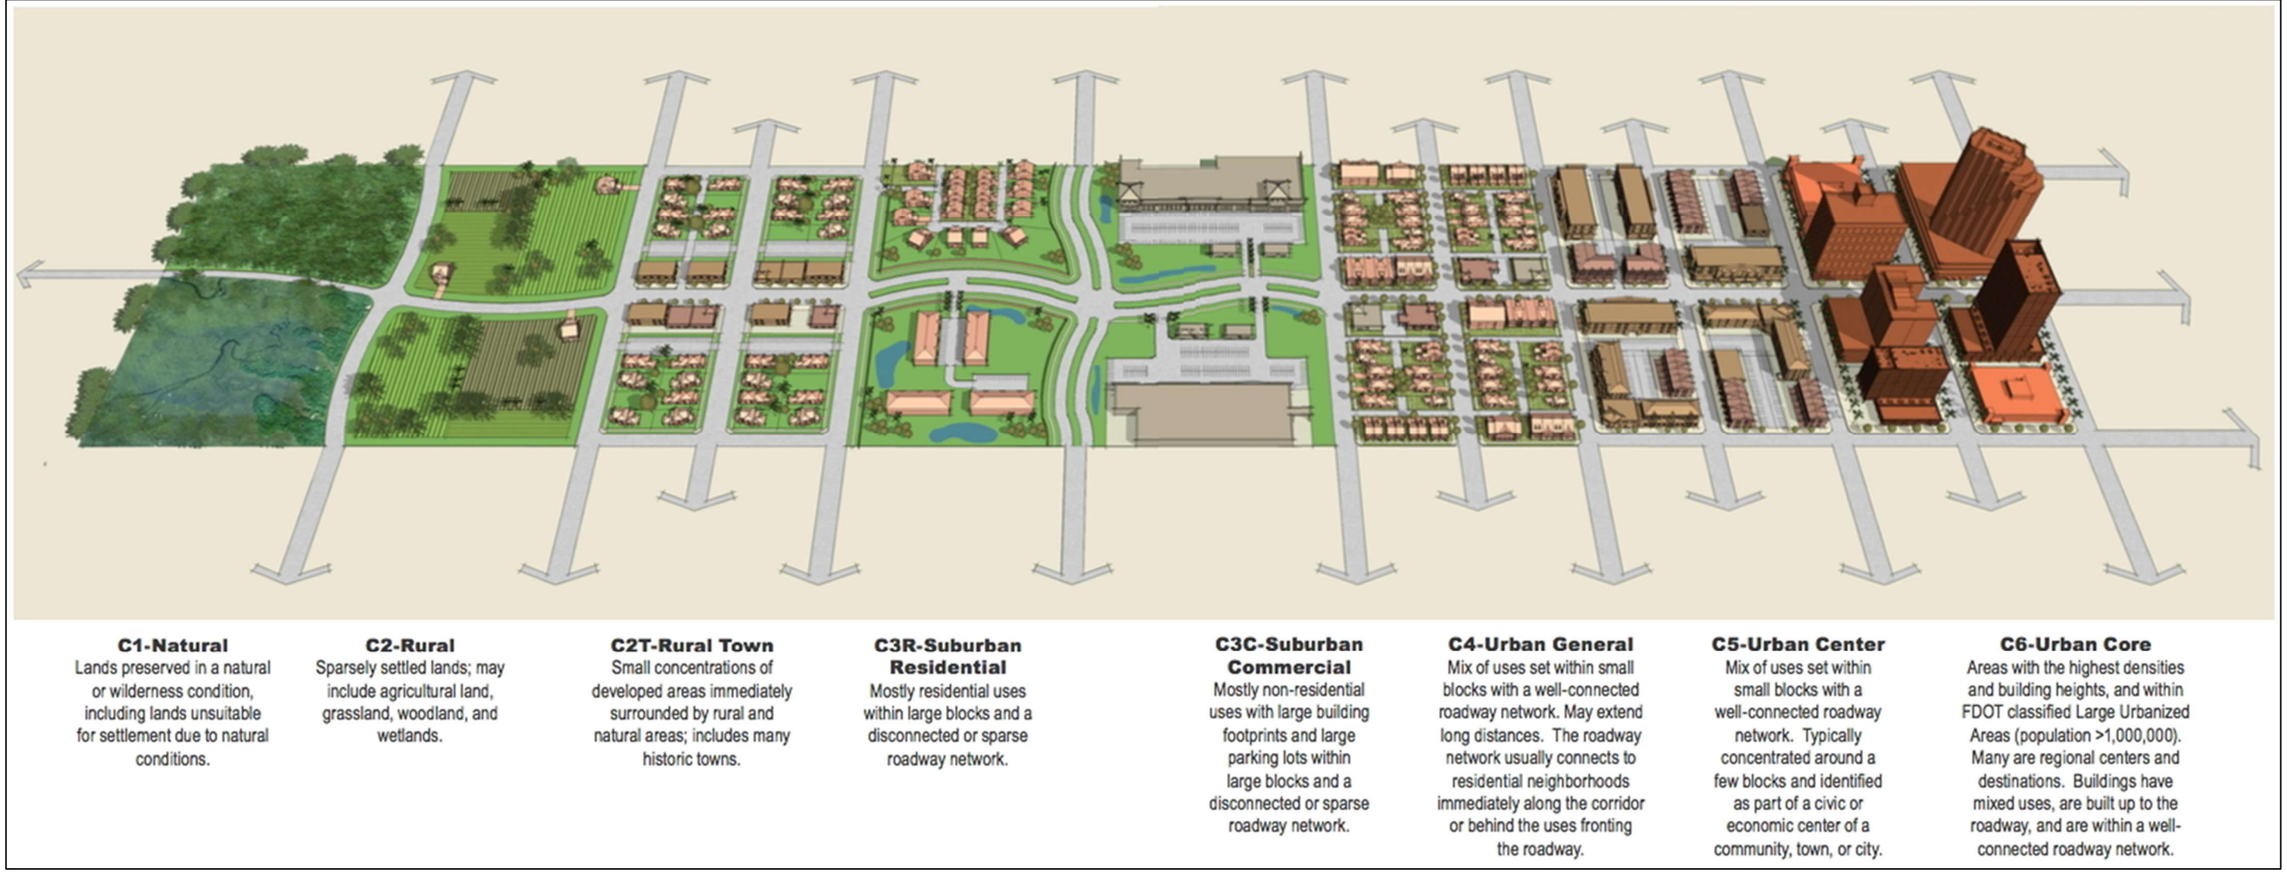
The characteristics of the community within the US 27 Mobility Study area are generally suburban in nature. There are also areas more rural and more urban present along the corridor. Only the area between the Lake Wales Ridge Wildlife Environmental Area to East Mountain Lake Cutoff Rd is expected to remain a rural area, which is due to the presence of the sensitive environmental lands.

As the corridor does travel through several jurisdictions, planning data from Lake Wales, Winter Haven, Dundee, Lake Hamilton, Haines City, and Polk County are continuing to be evaluated throughout this study to maintain consistency with existing and future character and land uses.

Within the US 27 Mobility Study area, the following FDOT context classifications are identified:

- C2 – Rural
- C3C – Suburban Commercial
- C3R – Suburban Residential
- C4 – Urban General

FIGURE 4-13: FDOT CONTEXT CLASSIFICATIONS



SOURCE: FDOT

Table 4-5 shows the existing and future context classification throughout the study area. For additional information about US 27 context classification, see the Polk County US 27 Context Classification Analysis produced by FDOT District One in May 2019. This document was used to produce this summary.

TABLE 4-5: US 27 EXISTING AND FUTURE CONTEXT CLASSIFICATION

Limits	Existing Context Classification	Future Context Classification	Notes
SR 60 to Lake Wales Ridge Wildlife and Environmental Area	C3C Suburban Commercial	C3C Suburban Commercial	Existing and future land use are primarily industrial and commercial; large blocks and a disjointed roadway network
Lake Wales Ridge Wildlife Environmental Area to E Mountain Lake Cutoff Rd	C2 Rural	C2 Rural	Low employment density; Existing conservation lands
E Mountain Lake Cutoff Rd to Lake Wales Boundary	C3C Suburban Commercial	C3C Suburban Commercial	Existing and future land uses are primarily industrial and commercial; large blocks and a disjointed roadway network
Lake Wales Boundary to Dundee Boundary	C2 Rural	C3C Suburban Commercial	Current low population density; future land use allows increased residential and commercial densities
Dundee Boundary to Frederick Ave	C3C Suburban Commercial	C4 Urban General	Existing LU includes mainly industrial and commercial; future land use allows increased residential and commercial densities
Frederick Ave to Haines City Boundary	C2 Rural	C3C Suburban Commercial	Current low population density; future land use allows increased residential and commercial densities
Haines City Boundary to Davenport Boundary	C3C Suburban Commercial	C3C Suburban Commercial	Existing land uses are primarily industrial and commercial; large blocks and a disjointed roadway network; future land use allows for increased density, however significant conservation areas are present
Davenport Boundary to Florida Pines Blvd	C2 Rural	C3C Suburban Commercial	Current low population density; future land use allows increased residential and commercial densities
Florida Pines Blvd to US 192	C3R Suburban Residential	C3R Suburban Residential	Existing and future land usesare primarily residential with large blocks and a disjointed roadway network

Figure 4-14 provides a visual representation of the existing and future context classification throughout the study area along US 27.

5 PHYSICAL CHARACTERISTICS

5.1 RIGHT-OF-WAY INFORMATION

Right-of-way information was collected using the results of the *US 27 Multimodal Corridor Existing Conditions Data Study* produced by FDOT and dated February 2019. This data provides information on the available existing right-of-way along the US 27 corridor. Due to the length of the corridor, the project is separated into ten segments, as shown in **Table 5-1**.

TABLE 5-1: EXISTING US 27 RIGHT-OF-WAY WIDTHS

Segment No.	Limits of Segment	Existing ROW Width Range
1	SR 60 to CR 540A	193′ – 236′
2	CR 540A to SR 540	200′ – 213′
3	SR 540 to SR 542	200′
4	SR 542 to SR 544	197′ – 229′
5	SR 544 to US 17/92	200′ – 245′

10	CR 54 (Ronald Reagan Pkwy) to US 192	200′ – 262′

Source: FDOT US 27 Multimodal Corridor Existing Conditions Data Study, 2019

5.2 BRIDGE STRUCTURES

Existing bridge structures information was also obtained from the *US 27 Multimodal Corridor Existing Conditions Data Study*. This data provides information regarding the existing structures along the US 27 corridor that can be used during development of alternatives to identify potential impacts to the structures. The details of the existing structures are summarized in **Table 5-2**.

TABLE 5-2: EXISTING US 27 STRUCTURES

Bridge	110036	US 192	1971	2014	1/4/2017	96.4

Source: FDOT US 27 Multimodal Corridor Existing Conditions Data Study, 2019

5.3 PRIMARY UTILITIES

Utility information for US 27 was also obtained from the *US 27 Multimodal Corridor Existing Conditions Data Study*. Information regarding the existing utilities along the US 27 corridor is shown in **Table 5-3**. This information will be used later during development of alternatives to identify potential conflicts with significant utilities.

TABLE 5-3: EXISTING US 27 PRIMARY UTILITIES

Utility Name	Utility Type	Crossroad/Extent	Parallel/Crossing
AT&T	Fiber Optic	US 17/92	Crossing
Florida Gas Transmission	Gas	Washington Avenue	Crossing
Florida Gas Transmission	Gas	Calabay Parc Boulevard	Crossing
Florida Public Utilities	Gas	US 17/92	Crossing
TECO People's Gas	Gas	County Line Road to US 17/92	Parallel
TECO People's Gas	Gas	Polo Park Boulevard to US 192	Parallel

5.4 DRAINAGE STRUCTURES

The *US 27 Multimodal Corridor Existing Conditions Data Study* also provided existing drainage structure information. Data for the existing major drainage structures (greater than 60 inches) along the US 27 corridor was provided. Eleven concrete box structures were noted in the report. This information will be used later during development of alternatives to identify potential impacts to drainage structures. Additional information from that report regarding these drainage structures is provided in **Appendix H**.

5.5 DRIVEWAYS

Under the Florida Department of Transportation (FDOT) Access Management system, US 27 is currently classified as having either a Class 2 or a Class 3 Access Management Classification along most of the project corridor. The exact segments and their respective classifications are shown below in **Table 5-4**.

FDOT Access Management guidelines state that roadways with a posted speed limit of more than 45 miles per hour (mph) and identified as Class 2 should have driveways spaced at least 1,320 feet apart. Roadways identified as Class 3 should have driveways spaced at least 660 feet apart. Roadways identified as Class 5 should have driveways spaced at least 440 feet apart.

North of the I-4 interchange, US 27 primarily has a Class 3 classification and land use is mostly residential so very few businesses have driveways present. Residences do not have direct driveway access to US 27 and instead have access to intersecting side streets. At the I-4 interchange, US 27 has a Class 2 classification and there are multiple driveways along both sides of US 27, between the interchange ramp terminal intersections. These driveways provide access to restaurants, hotels, and gas stations and are typically spaced between 100 and 300 feet apart.

TABLE 5-4: US 27 FDOT ACCESS MANAGEMENT CLASSIFICATION

US 27 Roadway Segments	FDOT Access Management Classification
US 192 to Poitras Rd 2	Class 2
Poitras Rd 2 to Access Rd	Class 3
Access Rd to south of Home Run Blvd	Class 2
South of Home Run Blvd to Blue Heron Blvd	Class 3
Blue Heron Blvd to W Johnson Ave	Class 5
W Johnson Ave to Frederick Ave	Class 3
Frederick Ave to Lincoln Ave	Class 2
Lincoln Ave to SR 60	Class 3

South of the I-4 interchange, US 27 is classified as Class 3 and driveways are few and far between until the area near Haines City. From Blue Heron Boulevard to W Johnson Avenue, US 27 is classified as Class 5 and driveways are typically spaced about 200 to 500 feet apart. South of Haines City in Dundee, US 27 is classified as Class 2 and driveways are typically spaced about 100 to 300 feet apart. In Lake Wales, driveways are spaced further apart than other areas. From Market Boulevard/Star Lake Drive, US 27 is classified as Class 3 and driveways are typically spaced about 300 to 600 feet apart.

Many segments have multiple driveways which do not meet the current spacing standards. Safe access to and from US 27 now and in the future is a concern along the corridor.

6 EXISTING CORRIDOR OPERATIONS SUMMARY

6.1 REGIONAL TRAVEL PATTERNS

Existing Origin-Destination information obtained from StreetLight data was used to identify and summarize existing regional travel patterns of all vehicles entering and exiting US 27 and/or the study area. The zones defined in *Section 3.6* as well as larger sub-regional zones were used for the following O-D analyses.

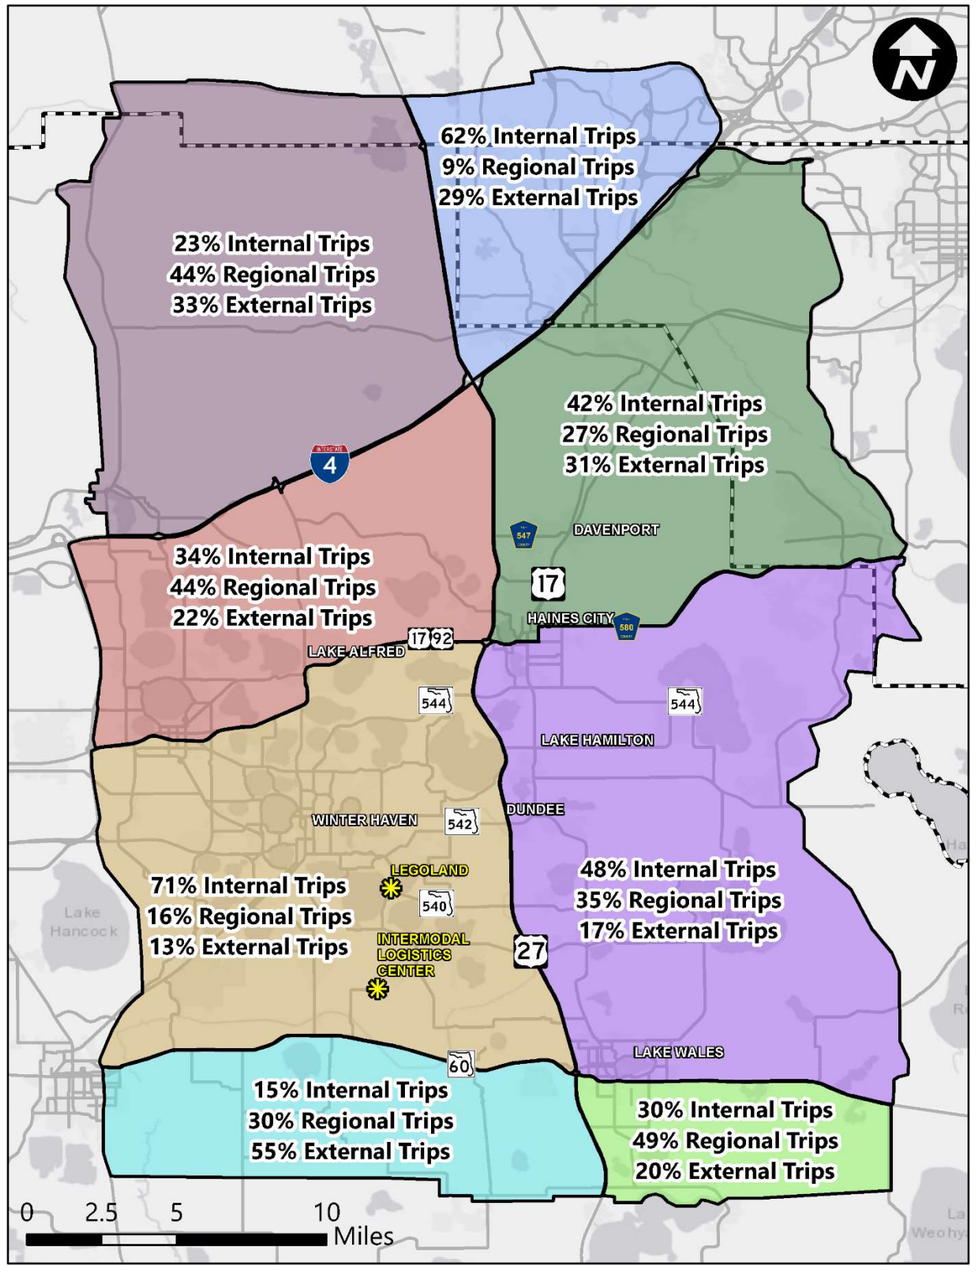
6.1.1 Sub-Regional Zones

The sub-regional zones map (**Figure 6-1**) depicts trip patterns within, between, and out of eight defined sub-regional zones adjacent to US 27.

- Internal trips: Trips that begin in that sub-regional zone and end in that sub-regional zone
- Regional trips: Trips that begin in that sub-regional zone and end in another one of the 8 sub-regional zones
- External trips: Trips that begin in that sub-regional zone and end outside of all 8 sub-regional zones

The light blue zone in the south-west corner has the highest (55%) external trips that are destined outside all 8 sub-regional zones. The tan zone which encompasses LEGOLAND and the Central Florida ILC, has the largest percentage of internal trips (71%), followed by the blue zone in the north-east corner with 62%. This indicates that these zones have a high internal capture and generate a lower percentage of trips that need to travel outside of that zone. This could indicate that more people are able to live and work within the same area, and their trips to work, school, or to the store can be more easily satisfied closer to home. The higher percentage of internal trips could also be related to the geographical size of the sub-regional zone. A trip of 10 miles within this zone could be considered an internal trip while a trip of the same distance could be considered an external trip in a smaller zone. Most of the 8 sub-regional zones show between 27% to 49% of their trips are traveling to one of the other 7 sub-regional zones.

FIGURE 6-1: SUB-REGIONAL ZONES ORIGIN-DESTINATION MAP



6.1.2 Northbound US 27 Pass-Through (Daily)

The "northbound US 27 pass-through" O-D data includes daily trips originating on US 27 south of SR 60. Of the many possible destination zones, this dataset includes I-4 west of US 27, I-4 east of US 27, and US 27 north of US 192 as destinations in order to evaluate the proportion of trips traveling the entirety of US 27 from SR 60 to the I-4 interchange.

As depicted in **Figure 6-2**, 9% of all trips originating on US 27 south of SR 60 proceed east on I-4, while 1.5% of trips proceed north on US 27 and only 0.2% of trips proceed west on I-4. Of the northbound trips traversing the length of US 27 from south of SR 60 to the I-4 interchange, the majority continue east on I-4 rather than traveling north on US 27 or west on I-4.

6.1.3 Southbound US 27 Pass-Through (Daily)

The "southbound US 27 pass-through" O-D data includes daily trips originating on US 27 north of US 192. Of the many possible destination zones, this dataset includes I-4 west of US 27, I-4 east of US 27, and US 27 south of SR 60 as destinations in order to evaluate the proportion of trips on US 27 north of US 192 traveling to other major regional roadway destinations within the study area.

As depicted in **Figure 6-3**, of the southbound trips on US 27 beginning north of US 192, 56.7% proceed east on US 192, while 3.3% proceed west on I-4, and less than one percent proceed east on I-4 and south on US 27 past SR 60. Thus, of trips originating on US 27 north of US 192, more than half continue east on US 192.

6.1.4 Northbound US 27 at I-4 AM Peak Period

The northbound US 27 at I-4 AM Peak Period O-D data includes trips originating on US 27 south of I-4. This dataset, depicted in **Figure 6-4**, considers three destinations:

- I-4 east of US 27
- I-4 west of US 27
- US 27 north of Ronald Reagan Parkway

Of the northbound vehicles originating on US 27 south of the I-4/US 27 interchange, the majority (51.3%) proceed east on I-4, while 13.2% continue north on US 27 and few (3.2%) proceed west on I-4. Thus, it can be inferred that a great deal of AM peak period traffic on northbound US 27 is bound for the Orlando area, east of the study area.

6.1.5 Westbound I-4 at US 27 PM Peak Period

The westbound I-4 at US 27 PM peak period O-D data includes trips originating on I-4 east of US 27. This dataset, depicted in **Figure 6-5**, considers three destinations:

- US 27 north of I-4
- US 27 south of I-4
- I-4 west of US 27

Of the westbound vehicles originating on I-4 east of the I-4/US 27 interchange, the majority (68.7%) continue west on I-4, while 18.8% proceed south on US 27 and few (0.3%) proceed north on US 27. Thus, it can be inferred that a significant portion of westbound traffic on I-4 diverts to US 27 south, which is supported by the traffic counts and field reviews conducted in support of this study.

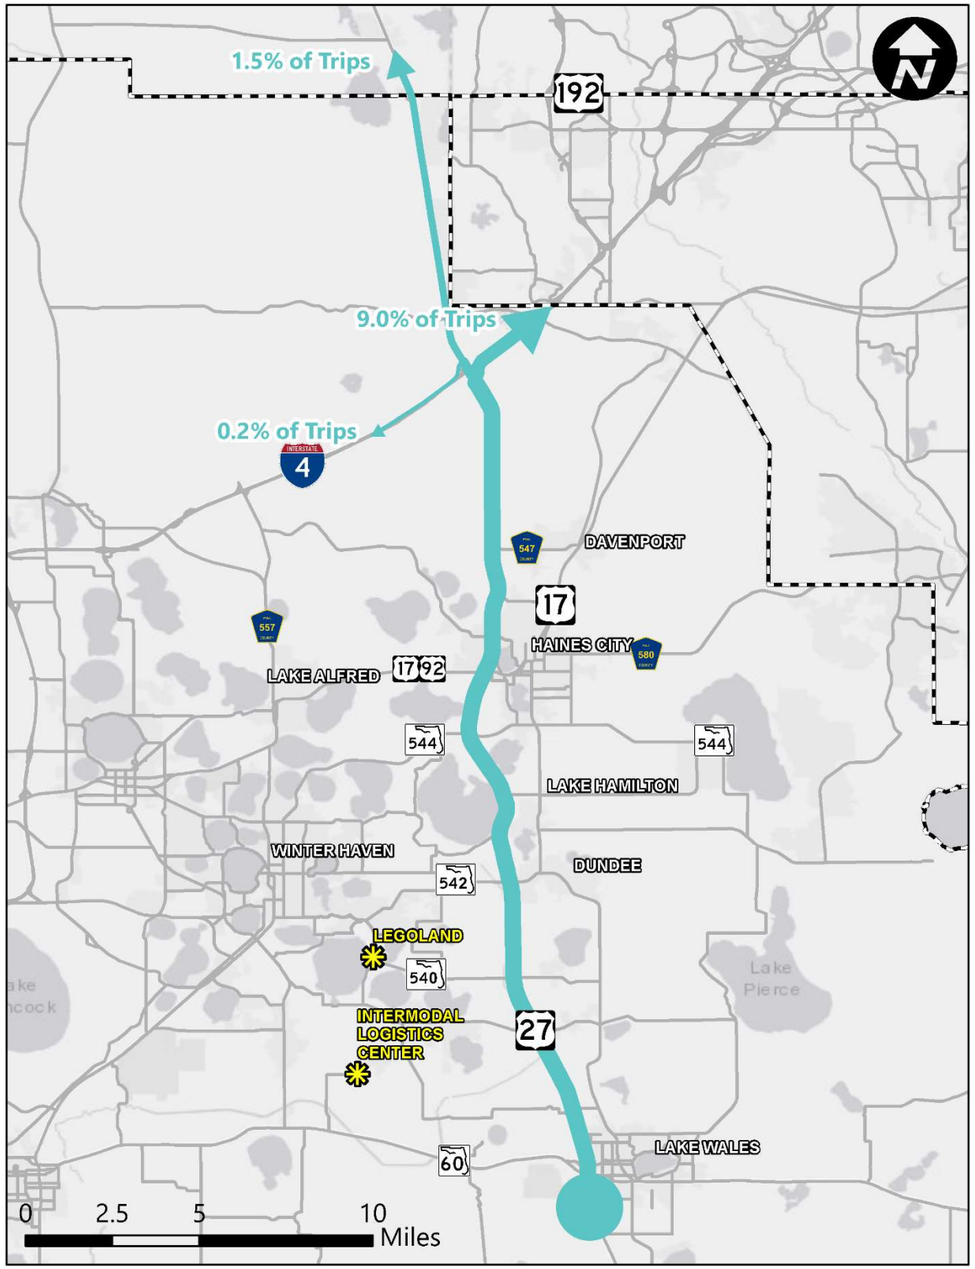

FIGURE 6-3: SOUTHBOUND US 27 PASS-THROUGH (DAILY) MAP

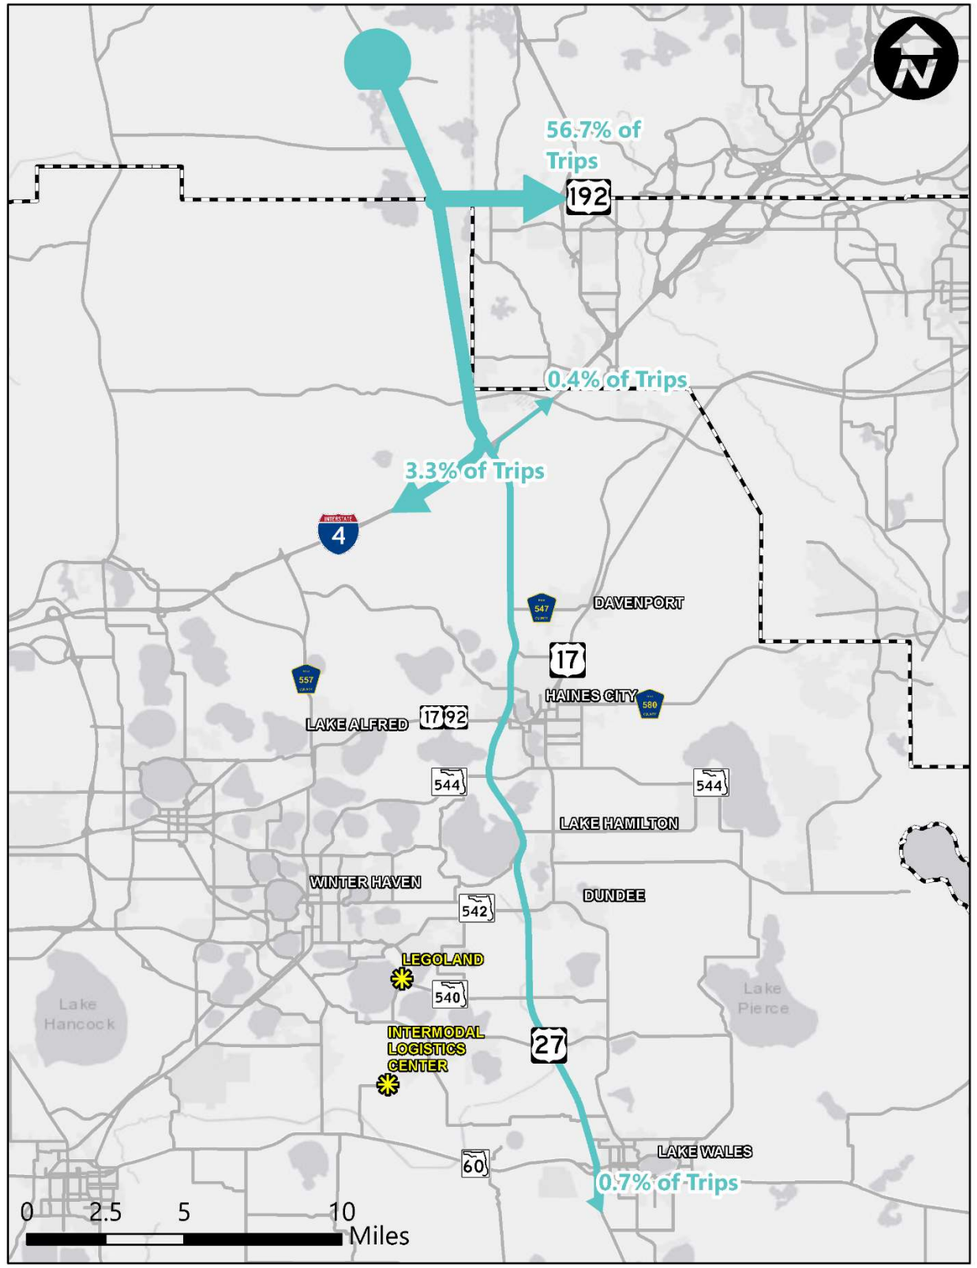

FIGURE 6-4: NORTHBOUND US 27 AT I-4 AM PEAK PERIOD MAP

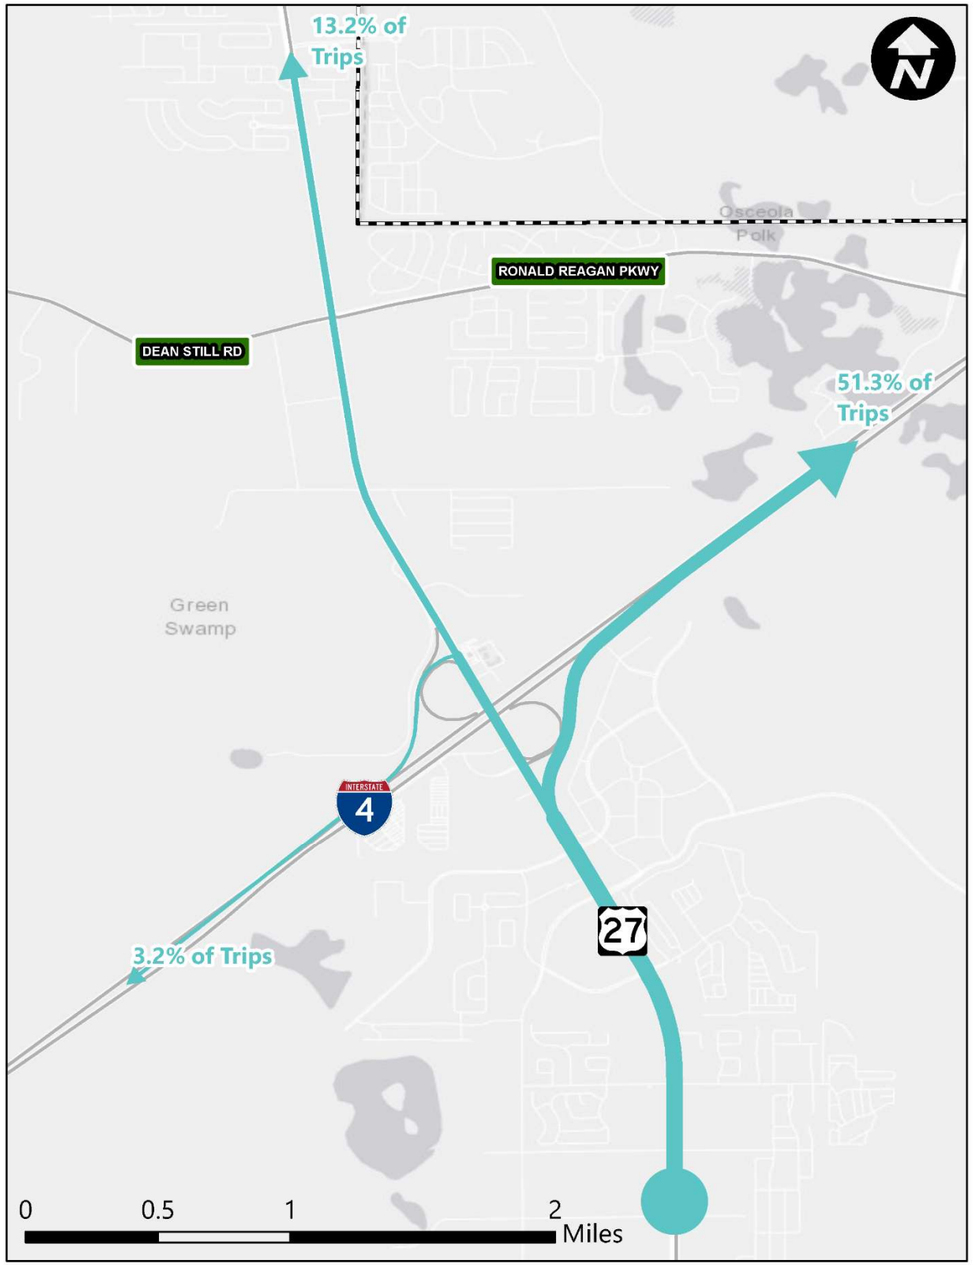

FIGURE 6-5: WESTBOUND I-4 AT US 27 PM PEAK PERIOD MAP

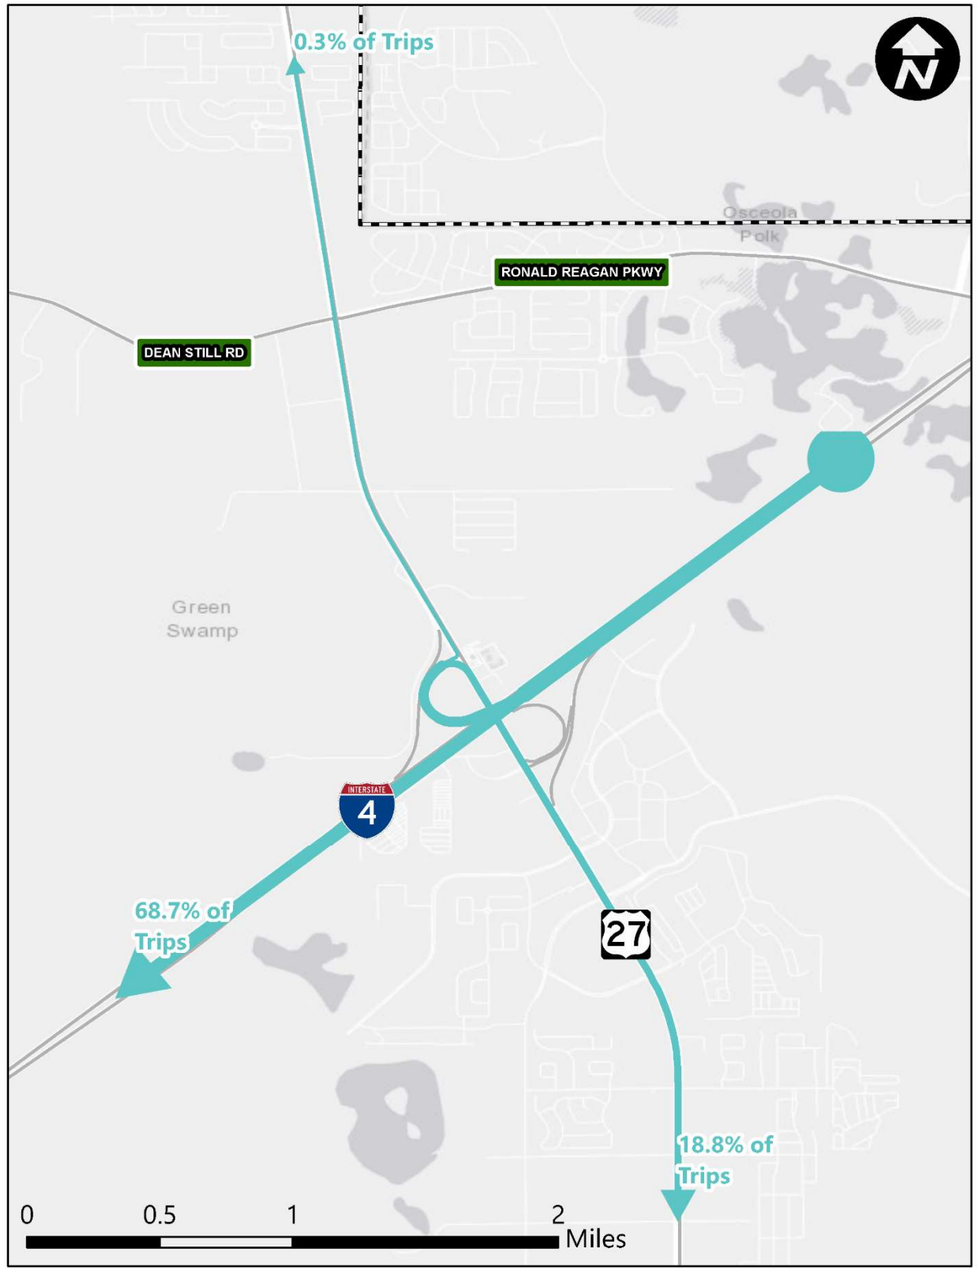

6.2 ROADWAY ANALYSIS

A variety of existing available data sources were utilized in order to identify congested roadway segments. These data sources include the following:

- Recent available FDOT traffic forecasting reports and operational analysis reports for US 27 (**Appendix A**)
- Twenty-four-hour tube counts and AM and PM peak hour turning movement counts collected along the US 27 corridor in 2018 for the study (**Appendix C**)
- The most recent (2018) annual Level of Service (LOS) report for state highways within Polk County available from FDOT District One (**Appendix I**)
- INRIX real-time traffic data from mobile devices
- Google Traffic™ real-time screen captures for "Typical Peak Hour Traffic" congestion during weekday AM and PM peak hours

6.2.1 Existing Traffic Conditions

Existing traffic conditions for the study area were assessed based on three types of analyses.

The US 27 roadway segment LOS analysis, and study intersection AM and PM peak hour LOS analysis, was conducted using recent available traffic count data from FDOT, and supplemented with 2018 traffic counts collected along the US 27 corridor for the study. The results of the US 27 segment LOS analysis and intersection LOS analysis are presented in Sections 6.2.2 and 6.2.3., respectively.

In addition, congestion assessments were completed for the US 27 corridor between SR 60 and US 192 based on RITIS INRIX data and Google Traffic. The results are presented in Section 6.2.4.

For state highways other than US 27 within the northeast Polk County regional study area, the FDOT District One 2018 annual LOS report was reviewed and the daily 2018 LOS results for state highways within the regional study area were summarized in Table I-1 in **Appendix I**. According to the report, SR 60 within the study area is shown to operate at LOS D or better. SR 540 primarily operates at LOS D or better, except for one segment at LOS F from 1st Street to 9th Street. SR 542 operates at LOS D or better, except for one segment from US 27 to CR 550. SR 544 operates at LOS D or better. US 17/92 operates at LOS D or better except for two segments: 1) from SR 17 to 17th Street, and 2) from Mckeown Avenue to 12th Street. I-4 operates at LOS F east and west of US 27.

6.2.2 Existing Conditions US 27 Roadway Segment LOS Analysis

In order to evaluate roadway segment Levels of Service, US 27 was divided into 13 segments within the study limits. The segmentation was based on a segment to segment AADT variance of 10% or more. For each segment, the highest AADT value was used in conjunction with the FDOT Generalized Level of Service tables and roadway characteristics in order to ascertain the segment LOS. The roadway segment LOS calculations are included in **Appendix J**. **Figure 6-6** depicts the segment Levels of Service as well as AADT values for each segment.

Based on the 2018 AADTs collected for the study corridor and shown in Figure 6-6, the segments of US 27 that are shown to be operating below the FDOT LOS target (LOS D for an urbanized area), are as follows:

- US 27 from Ridge Center Drive to Heller Bros Boulevard/Deer Creek Boulevard (LOS F)
- US 27 from Heller Bros Boulevard/Deer Creek Boulevard to I-4 (LOS F)

6.2.3 Existing Conditions US 27 Intersection LOS Analysis

Trafficware's *Synchro 10* was used to analyze each of the study intersections and HCM 6th Edition Methodology was used to report the performance measures where possible. For signalized intersections, HCM 6th Edition requires strict adherence to standard dual ring NEMA phasing and operating speeds between 25 miles per hour (mph) and 55 mph. Many cross streets along the corridor were low speed facilities serving as access to residential communities. Additionally, many segments along US 27 have speed limits of 60 mph. In order to produce HCM 6th Edition reports, speed limits outside the HCM 6th Edition speed limit range, were adjusted by a maximum of 5 mph so that HCM 6th Edition LOS results could be reported.

HCM 2000 results were reported where Synchro 10 could not provide HCM 6th Edition results. Synchro 10 Queue Reports were used for those signalized intersections where HCM 6th Edition Methodology could not be applied. Intersection performance was reported using HCM 6th Edition methodology for all intersections except the following three signalized intersections where LOS was reported using HCM 2000:

- US 27 at Eastbound I-4 Ramps
- US 27 at Sand Mine Road
- US 27 at SR 60

For unsignalized intersections, HCM 6th Edition reports provided all relevant performance measures. The HCM 6th Edition, HCM 2000 and Synchro 10 Reports for the signalized and unsignalized intersection AM and PM peak hour analyses are included in **Appendix K**. Traffic signal timing plans used for the signalized intersection analyses are included in **Appendix L**.

Table 6-1 presents the intersection LOS results as well as documents which Synchro reports were used to report the performance measurements. **Figure 6-7** depicts the existing intersection LOS as well as existing intersection turning movement volumes.

Currently, 21 of the 47 study intersections are operating at LOS E or F, which is below the FDOT LOS target D, in either the AM or PM peak hours. In order to reduce delay at the intersections with an overall LOS E or F, minor operational (short-term) improvements were evaluated and are summarized in Section 8.

TABLE 6-1: EXISTING CONDITIONS INTERSECTION ANALYSIS RESULTS

Intersection	Intersection Type	Reports Used	AM						PM					
			Intersection Delay (s)[1]	Intersection LOS[1]	Critical Mvment	Critical Mvment Delay (s)	Critical Mvment LOS	Critical Mvment 95th % Queue Length (ft)[2, 3]	Intersection Delay (s)[1]	Intersection LOS[1]	Critical Mvment	Critical Mvment Delay (s)	Critical Mvment LOS	Critical Mvment 95th % Queue Length (ft)[2, 3]

6.2.4 Existing Conditions US 27 Congestion Assessment

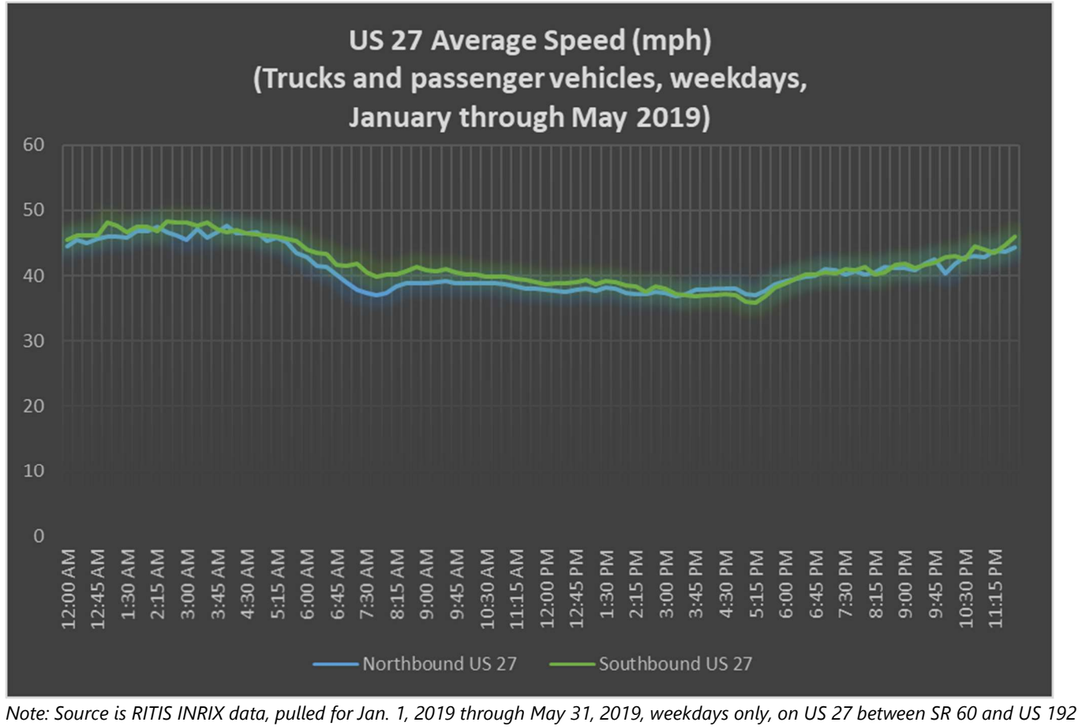
Speeds, travel times, and congestion scans were obtained from available INRIX data in the RITIS system. AM and PM peak hours were assessed based on typical weekday (Tuesday - Thursday) data downloaded for the dates of January 1, 2019 through May 31, 2019, during the months when school is in service.

FIGURE 6-8: US 27 CONGESTION SCAN

The congestion scan of US 27 shows that traffic in the southbound direction is somewhat congested from US 192 to I-4 from 7am to 7pm, with heavy congestion frequently occurring between CR-54/Deen Still Road and I-4 between 6:30am and 6pm. The heaviest congestion for southbound traffic on US 27 occurs at I-4 between 3pm and 6pm. In the northbound direction, US 27 traffic typically experiences some noticeable congestion between US 17/92 and Old Polk City Road between 7-9am, 11am-3pm, and 4:30-5:30pm. Northbound also typically experiences some congestion between I-4 and Deen Still Road from 7am-7pm.

Average speeds along US 27 in the northbound and southbound directions for all vehicles were also obtained through RITIS. **Figure 6-9** illustrates how average speed dips down from approximately 45 mph to between 36 and 40 mph in both directions from approximately 6:45am to 6:45pm.

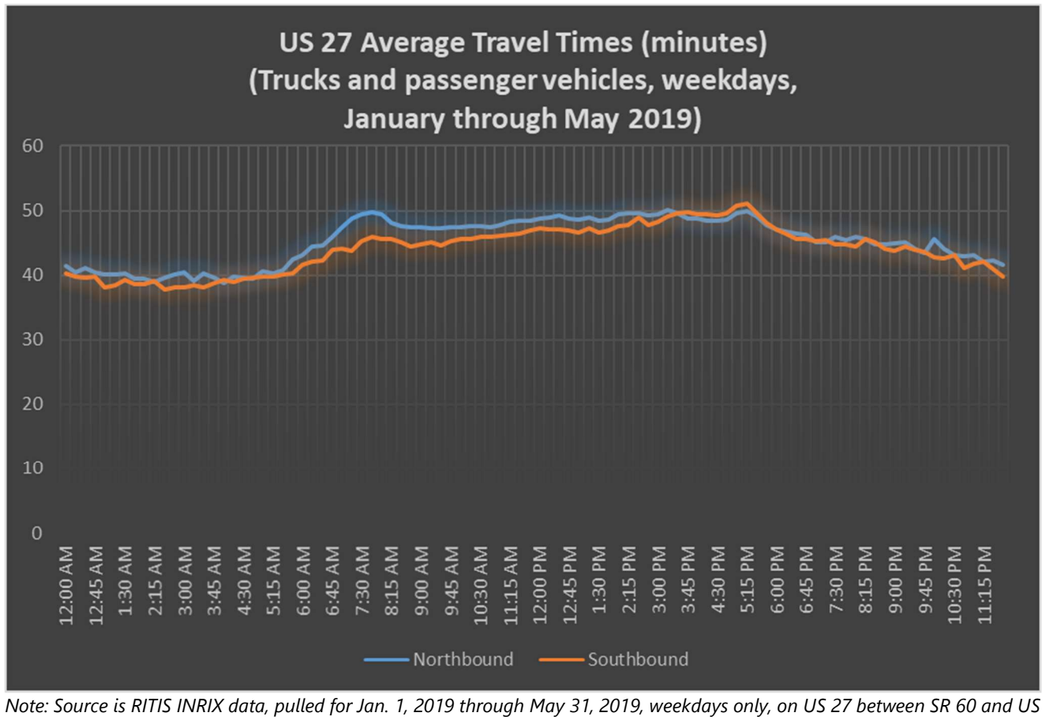
FIGURE 6-9: US 27 AVERAGE SPEED



Note: Source is RITIS INRIX data, pulled for Jan. 1, 2019 through May 31, 2019, weekdays only, on US 27 between SR 60 and US 192

The average travel times along US 27 from US -192 to SR 60, in the northbound and southbound directions, for all vehicles were also obtained through RITIS. **Figure 6-10** illustrates how average travel time is approximately 40 minutes in both directions between 12am and 6am. Between 6am and 5:15pm, travel time increases by 5 to 10 minutes for both northbound and southbound directions. After 5:15pm, travel times gradually decrease back down to approximately 40 minutes.

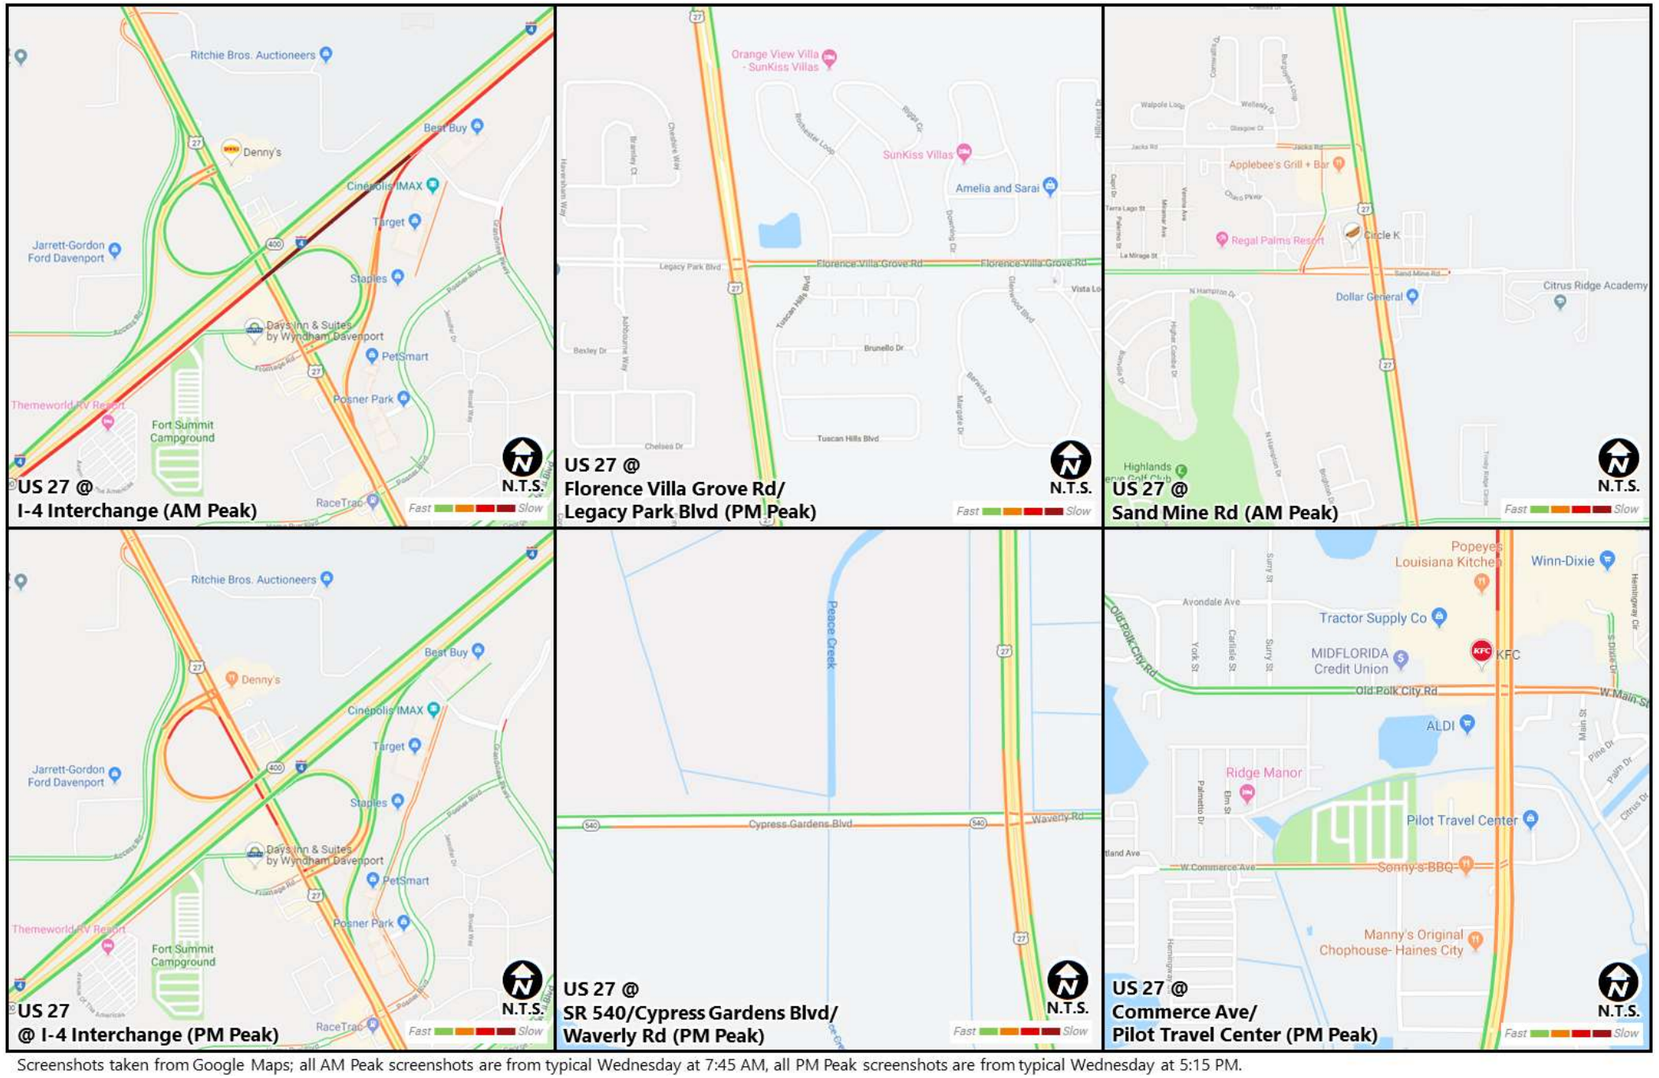
FIGURE 6-10: US 27 AVERAGE TRAVEL TIME



Note: Source is RITIS INRIX data, pulled for Jan. 1, 2019 through May 31, 2019, weekdays only, on US 27 between SR 60 and US 192

Screenshots were taken from Google Maps Typical Traffic Conditions as supporting information to the Existing Conditions analysis results. Each study intersection was observed on Google Maps during both an AM typical weekday condition and PM typical weekday condition and compared to the results obtained from Synchro. The six intersections in **Figure 6-11** showed poor operational results in the Synchro analysis during the indicated peak hour, and the Google Maps Typical Traffic Conditions screenshots support the results.

FIGURE 6-11: TYPICAL GOOGLE MAPS TRAFFIC CONDITIONS



Screenshots taken from Google Maps; all AM Peak screenshots are from typical Wednesday at 7:45 AM, all PM Peak screenshots are from typical Wednesday at 5:15 PM.

6.3 EXISTING BICYCLE ANALYSIS

To evaluate the quality and Level of Service (LOS) of the bicycle facilities along US 27, the FDOT Quality/Level of Service (Q/LOS) analysis methodology was used. The level of service is generally indicated with a letter grade A through F, with "A" being a facility that is perceived by the user to be optimal, while "F" would be perceived to be the poorest conditions. The average annual daily traffic (AADT) relative to the number of roadway lanes present, along with the coverage of bicycle lanes and/or paved shoulders, are the factors used to determine the bicycle mode LOS.

The existing bicycle facilities along US 27 are shown on **Figure 3-2,** and **Table 6-2** shows a tabular inventory of the existing bicycle infrastructure within the study limits.. The presence of bicycle lanes was determined by whether there were bicycle lane pavement markings or if 5 foot wide (or greater than 5 foot wide) paved shoulder was accompanied by keyhole lanes present at intersections. For each roadway segment, the northbound (NB) and southbound (SB) facilities were considered together. A lack of a bicycle facility on one *or both* sides of a segment was considered to be a wholly deficient segment. As a major arterial roadway, standard facilities should be available for all users.

To determine LOS the AADTs on each segment were compared to the Generalized Service Volume Table (GSVT) two-way maximum service volumes as presented in the FDOT Quality/Level of Service Handbook, based on percent coverage of bicycle facilities. The FDOT two-way maximum service volumes for 0-49% coverage were applied where a designated bicycle lane or paved 5 foot wide (or greater) shoulder does not exist on both sides of the road. If a designated bicycle lane or a paved 5 foot wide (or greater) shoulder exists on both sides of US 27, then coverage was considered to be 100% and the FDOT two-way maximum service volumes for 85-100% coverage were applied. The LOS was determined for each segment. The details of this analysis are summarized in Table M-1 in **Appendix M**.

Notes: (1) SB = Southbound; NB = Northbound (2) See Figure 3-2, Sheets 8, 9

Figure 6-12 presents the Bicycle Q/LOS along the US 27 corridor. **Table 6-3** summarizes the distance along US 27 that is considered to have a Q/LOS of C, D, E or F.

TABLE 6-3: NUMBER OF MILES PER BICYCLE Q/LOS LEVEL

Bicycle Q/LOS	Miles of US 27 Corridor
C	23.71 miles
D	4.64 miles
E	3.0 miles
F	0.69 miles

Approximately 88.5% of the US 27 corridor has an acceptable bicycle Q/LOS of D or better. Eleven and a half, or approximately 3.7 miles of US 27 has an undesirable LOS E or F. As daily vehicular traffic on US 27 increases with area and regional population and employment growth, the Q/LOS of existing facilities is expected to degrade.

Segments listed in **Table 6-4** are considered to have deficient bicycle facilities.

6.4 EXISTING PEDESTRIAN ANALYSIS

To evaluate the quality of the pedestrian facilities along US 27, the FDOT Q/LOS analysis methodology was used. For pedestrian Q/LOS, each roadway segment was evaluated to note whether sidewalk was present. A lack of facility on one or both sides of a segment was considered to be a wholly deficient segment. As a major arterial roadway, standard facilities should be available for all users.

The FDOT Q/LOS Handbook Table 1 for Urbanized Areas was referenced for Pedestrian Mode to determine the Q/LOS. The FDOT two-way maximum service volumes for 0-49% coverage were applied where a sidewalk does not exist on both sides of the road. Where sidewalk exists on both sides of US 27, then coverage was considered to be 100% and the FDOT two-way maximum service volumes for 85-100% coverage were applied. The AADTs along US 27 were compared to the Generalized Service Volume Table (GSVT) two-way maximum service volume thresholds as presented in the FDOT Quality/Level of Service Handbook. The Pedestrian Mode Q/LOS results were determined for each segment and the details of the analysis are provided in **Table M-2** in Appendix M.

Figure 6-13 shows the pedestrian Q/LOS along the US 27 study corridor. **Table 6-5** summarizes the distance along US 27 that exhibits each Pedestrian facility Q/LOS.

TABLE 6-4: NUMBER OF MILES PER PEDESTRIAN Q/LOS LEVEL

Pedestrian Q/LOS	Miles of US 27 Corridor
C	1.0 miles
D	10.01 miles
E	0.43 miles
F	20.52 miles

Pedestrian facility Q/LOS is considered acceptable at Q/LOS D or better. Approximately 35% of the corridor has an acceptable pedestrian LOS, while the other 65% of the corridor is below standard at LOS E or F. **Table 6-6** lists the sections of the US 27 corridor with deficient pedestrian facilities. As daily vehicular traffic on US 27 increases with area and regional population and employment growth, the Q/LOS of existing facilities is expected to degrade, and additional segments will fall below acceptable Q/LOS standard D.

7 ROADWAY SAFETY AUDIT

7.1 DATA COLLECTION

7.1.1 Data Collection

Crash data for the study area was obtained from the FDOT State Safety Office Geographic Information System (SSOGis) Crash Query Tool for the years 2013 through 2017 and Signal 4 for the year 2017. Signal4 data was used for more recent data (2017) since CARS data was not available for 2017. The crash data included information including date of crash, location, number of vehicles involved, type of crash, number of injuries and/or fatalities, cause of crash, and estimated economic loss.

Due to the use of the two sources for the year 2017 crash data, Signal 4 crashes were reconciled, and all duplicate records removed compared to the SSOGis 2017 data. The crash data was gathered within a 250-foot buffer around the US 27 corridor between SR 60 and US 192, which included crashes along sidestreets within the buffer.

The crash analysis results reveal that there was a total of 3,451 crashes within the study area during this five-year period (2013-2017). Of these 3,451 crashes, rear-end collisions were the most common crash type, accounting for 47.4% followed by heavy vehicle crashes (14.5%) and angle crashes (12.5%). A total of 136 crashes (3.9%) resulted in a fatality or severe incapacitating injury and 25% occurred during dark conditions. **Table 7-1** summarizes the crash data for the entire study area, spanning from SR 60 to US 192 (SR 530). **Table 7-2** summarizes the crashes by severity along US 27 for this 5-year period. **Table 7-3** summarizes the crashes by lighting conditions.

In addition, **Figure 7-1** on the following pages shows the number of crashes by crash type and severity, per location, for both segments and intersections along the entire length of the US 27 study corridor. Crash summary tables for the highest ranked 10 intersections and two segments along the US 27 study corridor, are included in **Appendix N**.

7.1.2 Corridor-Wide Crash Analysis & Identification of High Crash Locations

Corridor wide daytime and nighttime field inventory was conducted in order to identify any potential correlation between high crashes locations where minimal to no infrastructure is available for pedestrians and bicycles along with data collected and described previously in Section 3, such as existing geometry and AADTs for intersection approaches and within segments along the corridor. The information was used to evaluate high crash locations based on a weighted ranking methodology as follows:

1. Intersections - Available total entering volumes was used to determine which intersections (signalized or unsignalized) were analyzed and ranked. The number of crashes per Million Entering Vehicles (MEVs) was determined for study intersections within the US 27 study corridor. The area of influence was defined as each leg of the intersection, up to 250 feet from the stop bars.
2. Segments - Roadway segments along US 27 between SR 60 and US 192 were defined based on roadway characteristics and volume. The roadway segments along US 27 were then analyzed and ranked according to multiple criteria, including:
   - Number of crashes
   - Vehicular Crashes per mile (annualized)
   - Bike and Ped Crashes per mile
   - Crashes per 10,000 daily trips
   - Percent of severe crashes (fatal and incapacitating injury crashes)
   - Percent of crashes occurring during dark conditions

A composite ranking factor based on the criteria described previously was developed to identify high crash locations. **Tables 7-4, 7-5, and 7-6** provide details of the intersection, segment and a combined composite factor used to rank high crash locations within the study area. Due to on-going and future studies at the ramp junctions and segment for I-4, this area was omitted in consideration of this analysis. The top 10 ranked intersections and top 2 ranked segments were as follows:

1. Tower Point Circle (unsignalized intersection)
2. Thompson Nursery Road / Chalet Suzanne Road (signalized intersection)
3. SR 540 (Cypress Gardens Boulevard) / Waverly Road (signalized intersection)
4. Sunshine Drive / Paradise Island Place (unsignalized intersection)
5. US 17 Interchange (interchange)
6. Deen Still Road / Ronald Reagan Parkway (signalized intersection)
7. California Boulevard / McFee Drive (signalized intersection)
8. Sand Mine Road (signalized intersection)
9. Legacy Park Boulevard / Florence Villa Grove Road (signalized intersection)
10. Polo Park Boulevard (signalized intersection)
11. From Deen Still Road / Ronald Reagan Parkway to California Road / McFee Road (segment)
12. From California Road / McFee Road to Legacy Park Boulevard / Florence Villa Grove Road (segment)

7.1.3 Road Safety Audit Field Reviews

Using the top ten ranked intersections and two of the top ranked segments, three (3) audit teams were organized to conduct the road safety field reviews. The members of the teams were invited based on their knowledge and experience. As part of the road safety audit, field reviews were conducted during daytime off-peak times, and a nighttime field audit was also conducted. The teams collected data at the intersections and segments to identify deficiencies of the existing conditions including sidewalks, lighting, crosswalks, transit facilities, signage, and midblock median openings. Potential improvements were identified, and photos of the study locations were taken. The details of the road safety audits were published under a separate document as *FDOT D1 Road Safety Audit: US 27 from North of SR 60 to US 192,* dated June 2019.

7.2 FINDINGS AND COUNTERMEASURES

The top 10 ranked intersections and top two ranked roadway segments were selected for road safety field reviews.

Intersections

1. US 27 and Tower Point Circle Intersection - General findings included no street lighting, no sidewalks, heavy southbound U-turn volume and bus stops with no amenities. The safety countermeasures proposed include converting the full median opening into a bi-directional median opening, improving street lighting, providing additional signage and updating bus stops with pads and shelter/bench amenities including sidewalk connectivity.

2. US 27 and Thompson Nursery Road/Chalet Suzanne Road intersection - General findings included limited sidewalk connectivity, long sidewalk gaps, minimal lighting at intersection, uneven pavement, and missing overhead lighted street sign. The safety countermeasures proposed include installing high visibility crosswalk pavement marking, updating pedestrian assemblies to current ADA standards, installing/filling in sidewalk gaps, improving street lighting, and installation of various signs and signals.

3. US 27 and Cypress Gardens Boulevard/Waverly Road - General findings included rutting of pavement, off-tracking of vehicles onto sidewalks on most corners, missing or damaged detectable warning pads and general maintenance issues such as leftover crash debris or overgrown vegetation. The safety countermeasures proposed include installation of high visibility crosswalks, updating pedestrian assemblies to current ADA standards, repairing pavement rutting and markings, and installation of various signs and signals.

4. US 27 and Sunshine Drive/Paradise Island Place - General findings included higher vehicle travel speeds, no sidewalks, no street lighting, high U-turn volumes from the north and no stop sign on Sunshine Drive. The safety countermeasures proposed include converting the full median opening into a bi-directional median opening, improving street lighting, installing a stop sign on Sunshine Drive and providing additional signage.

5. US 27 and US 17/US 92 interchange - General findings here included a short concrete median wall, short merge/diverge auxiliary lanes northbound and southbound, and no bike or pedestrian facilities. The safety countermeasures proposed include improving lighting to be continuous along the bridge, installing signage and pavement markings for bike lanes, installing sidewalks and building pedestrian paths on both sides of bridge.

6. US 27 and Ronald Reagan Parkway/Deen Still Road - General findings here included high U-turn volumes on east and north leg, missing signal head for northbound and southbound right-turns, faded pavement markings and off-tracking of vehicles onto sidewalks. The safety countermeasures proposed include installing high visibility crosswalks, updating pedestrian assemblies to current ADA standards, repairing pavement markings, repairing cracked or uneven sidewalks, installing bike key hole pavement markings on all four legs, and installation of various signs and signals.

7. US 27 and California Boulevard/McFee Drive - General findings here included no lighting at intersection or along approaches, high U-turn volumes on the northbound approach, and off-tracking

onto sidewalks which has caused damage to the concrete sidewalks. The safety countermeasures include installing high visibility crosswalks, updating pedestrian assemblies to current ADA standards, repairing cracked and uneven sidewalks, installing additional street lighting, and installation of various signs and signals.

8. US 27 and Sand Mine Road - General findings here included off-tracking on the southwest and northwest corners, vehicle speeding, no street lighting and eastbound visibility issues. The safety countermeasures proposed include installing high visibility crosswalks, updating pedestrian assemblies to current ADA standards, realigning crosswalks on north and south approaches, connecting transit shelters south of intersection to inside sidewalk, and install street lighting on US 27.

9. US 27 and Legacy Park Boulevard/Florence Villa Grove Road - General findings here included off-tracking on all approaches, damaged pedestrian crossing signal, no street lighting and no sidewalk connection to Florence Villa Grove Road from US 27. The safety countermeasures proposed include installing high visibility crosswalks, updating pedestrian assemblies to current ADA standards, realigning the crosswalk on the north and south approaches, installing street lighting on US 27, and connecting the sidewalk from US 27 to Florence Villa Grove Road.

10. US 27 and Polo Park Boulevard - General findings here included off-tracking on the southwest and southeast corners, erosion and drainage run-off at the northwest and southwest quadrants, and no street lighting. The safety countermeasures proposed include installing high visibility crosswalks, updating pedestrian assemblies to current ADA standards, realigning the crosswalks of all approaches, installing sidewalk at the southeast quadrant on Polo Park Boulevard, and installing street lighting on US 27.

Segments

1. US 27 from Ronald Reagan Parkway/Deen Still Road to California Boulevard/McFee Drive - Along this roadway segment, three unsignalized intersection and one signalized intersection were also observed. At the intersection of Central Grove Road general findings included severe rutting/drop off on west leg of intersection and possible sight distance issues for northbound and eastbound vehicles. At the intersection of Four Corners Boulevard general findings included rutting and off-tracking on all four corners, faded pavement markings on Bella Citta Boulevard, and non-functioning pedestrian signal in the southwest corner. At the intersection of Elgin Boulevard general findings included no sidewalk connections to bus stops and off-tracking of vehicles in southeast and northwest corners. At the intersection of Ogelthorpe Road general findings included high U-turn volumes in the northbound direction and a school bus stopping in the southbound right-turn lane, blocking the entrance to the road. Southbound cars also did not stop for the school bus.

    - The safety countermeasures proposed along the entire roadway segment include improving sidewalks, improving street lighting, updating bus stops with pads and shelter/bench amenities and determining crossing locations with updates to school signs.
    - The safety countermeasures proposed for the intersection of Central Grove Road include installing high visibility crosswalks, repairing/replacing damaged signage and repainting pavement markings as needed
    - The safety countermeasures proposed for the intersection of Four Corners Boulevard include updating pedestrian assemblies to current ADA standards and considering a split phase signal due to permissive left turn/aggressive drivers.
    - The safety countermeasures proposed at the intersection of Elgin Boulevard include installing high visibility crosswalks, updating pedestrian assemblies to current ADA standards, repairing/replacing damaged signage and repainting pavement markings as needed.
    - The safety countermeasures proposed at the intersection of Ogelthorpe Road include installing high visibility crosswalks, updating pedestrian assemblies to current ADA standards, repairing/replacing damaged signage and repainting pavement markings as needed.

2. US 27 from California Boulevard/McFee Drive to Legacy Park Boulevard/Florence Villa Grove Road - Along this roadway segment, three unsignalized intersection and three signalized intersections were also observed. At the intersection of Florida Avenue general findings included missing detectable warning pad in the northwest corner, rutting/drop off on the west leg of intersection, possible need for handrails adjacent to sidewalks in southwest and northwest quadrants, and no lighting on US 27. At the intersection of Ridgeway Boulevard general findings included rutting on the northeast quadrant and no street lighting. At the intersection of Highlands Boulevard/Student Drive general findings included damaged sidewalk on Student Drive, no street lighting and no transit stops. The intersection of Sand Mine Road was previously reviewed. At the intersection of Jack's Road general findings included painted pavement markings. The intersection of Legacy Park Boulevard/Florence Villa Grove Road was previously reviewed.

    - The safety countermeasures proposed along the entire roadway segment include improving sidewalks, improving street lighting, updating bus stops with pads and shelter/bench amenities and determining crossing locations with updates to school signs.
    - The safety countermeasures proposed at the intersection of Florida Avenue include installing high visibility crosswalks and updating pedestrian assemblies to current ADA standards.
    - The safety countermeasures proposed at the intersection of Ridgeway Boulevard include installing high visibility crosswalks and repairing/retrofitting curb radius to eliminate rutting/off-tracking damage.
    - The safety countermeasures proposed at the intersection of Highlands Reserve Boulevard/Student Drive include updating pedestrian assemblies and curb ramps to current ADA standards and considering a split phase signal due to permissive left turn/aggressive drivers.
    - The safety countermeasures at the intersection of Sand Mine Road were previously discussed.
    - The safety countermeasures at the intersection of Jack's Road include installing high visibility crosswalks, updating curb ramps to current ADA standards, replacing painted pavement striped bulb-out, and installing a posted speed limit sign.
    - The safety countermeasures at the intersection of Legacy Park Boulevard/Florence Villa Grove Road were previously discussed.

More detailed findings for each intersection and roadway segment can be found in the separately published *FDOT D1 Road Safety Audit: US 27 from North of SR 60 to US 192,* dated June 2019.

8 SHORT-TERM IMPROVEMENTS

8.1 DEVELOPMENT OF SHORT-TERM IMPROVEMENTS

Short term improvements were determined based on analysis of existing (2018) conditions intersection traffic operations and safety related deficiencies. Short term intersection improvements were developed to address 2018 AM and PM peak hour level of service / delay deficiencies identified at study intersections identified through the Synchro analysis and the recommended improvements resulting from the roadway safety audits.

The improvements were grouped together based on intersection location and type of improvement. Short-term improvement recommendations are summarized in **Table 8-1** below.

TABLE 8-1: SUMMARY OF SHORT-TERM IMPROVEMENTS

No.	Intersection	Intersection Type	Synchro Traffic Operations - Short Term Improvement Recommendations	RSA Safety - Short Term Improvement Recommendations
1	Tower Point Ent / Vanguard School Ent	Unsignalized	Convert to a directional median opening, allowing only right-turns from side street.	Convert full median opening to bi-directional median opening, maintenance items, improve pavement markings, improve street lighting.
2	Thompson Nursery Rd / Chalet Suzanne Rd	Signalized	N/A	Improve signs and pavement markings; install curbs, signs, and maintenance items; improve street lighting.
3	SR 540 / Cypress Gardens Blvd / Waverly Rd[1]	Signalized	Convert eastbound right-turn lane into a channelized, free-flowing right-turn lane. To accommodate the free-flowing traffic, widening southbound US 27 to provide acceleration lane is recommended.	Install signs, maintenance items, install additional street lighting.
4	Lincoln Ave	Unsignalized	Convert to a directional median opening, allowing only right-turns from side street.	N/A
5	Frederick Ave	Unsignalized	Convert to a directional median opening, allowing only right-turns from side street.	N/A
6	Kokomo Rd	Unsignalized	Convert to a directional median opening, allowing only right-turns from side street.	N/A
7	Sunshine Dr / Paradise Island Pl	Unsignalized	Convert to a directional median opening, allowing only right-turns from side street.	Convert full median opening to bi-directional median opening, additional signage at full median opening, add stop sign at Sunshine Dr, maintenance items, improve street lighting.
8	US 17/ US 92	Interchange	N/A	Maintenance items; install signs, sidewalks, and pedestrian paths; improve lighting.
9	W Johnson Rd	Unsignalized	Convert to a directional median opening, allowing only right-turns from side street.	N/A
10	Section 7 Airport Rd / Parson Rd / Patterson Rd	Unsignalized	Convert to a directional median opening, allowing only right-turns from side street.	N/A
11	South Blvd	Unsignalized	Convert to a directional median opening, allowing only right-turns from side street.	N/A
12	Holly Hill Cutoff Rd / North Blvd W	Unsignalized	FDOT D1 decision to signalize intersection.	N/A
13	La Casa Del Sol Blvd	Unsignalized	Convert to a directional median opening, allowing only right-turns from side street.	N/A
14	Holly Hill Tank Rd / Florida Development Rd	Unsignalized	Convert to a directional median opening, allowing only right-turns from side street.	N/A
15	Holly Hill Grove Rd 2 / Cottonwood Rd	Unsignalized	Signalize intersection. Permitting left-turn phasing for eastbound and westbound approaches, added left-turn lanes for eastbound and westbound approaches.	N/A
16	Ronald Reagan Pkwy / Deen Still Rd	Signalized	N/A	Maintenance items, install signs and pavement markings; install lighting on Deen Still Rd.

[1] Additional Optional Short-Term Improvement Recommendation: Provide an additional eastbound right-turn lane, change phasing to allow eastbound right-turn overlap

TABLE 8-1: SUMMARY OF SHORT-TERM IMPROVEMENTS (CONTINUED)

No.	Intersection	Intersection Type	Synchro Traffic Operations - Short Term Improvement Recommendations	RSA Safety - Short Term Improvement Recommendations
17	Laurel Estates Access / Ogelthorpe Dr	Unsignalized	Convert to a directional median opening, allowing only right-turns from side street.	Add signage and improve pavement marking at full median opening, replace damaged signs, improve lighting as needed.
18	Elgin Blvd / Santa Cruz Lane / Cardiff Ave	Unsignalized	Convert to a directional median opening, allowing only right-turns from side street.	Add signage and improve pavement marking at full median opening, replace damaged signs, improve street lighting as needed.
19	Four Corners Blvd / Bella Citta Blvd	Signalized	Change signal to operate as split phased for eastbound/westbound.	Repair and add corrects signage, consider split phase signal, improve street lighting as needed.
20	Central Grove Rd / Terra Del Sol Blvd	Unsignalized	Signalize intersection, operate as split phased for eastbound/westbound.	Add sign and improve pavement marking at full median opening, replace damaged signs, improve street lighting as needed.
21	California Blvd / McFee Dr	Signalized	N/A	Maintenance items; install sidewalks, signs, and pavement markings; install additional lighting at intersection.
22	Florida Ave	Unsignalized	N/A	Add signage and improve pavement marking at full median opening, replace damaged signs, improve street lighting as needed.
23	Highlands Reserve Blvd / Student Dr	Signalized	Change signal to operate as split phased for eastbound/westbound.	Install / repair signs and pedestrian assemblies, maintenance items, consider split phase signal, improve street lighting as needed.
24	Sand Mine Rd	Signalized	Dual left-turn lanes on eastbound and westbound approaches, converting right-turn only lanes into shared thru/right-turn lanes, protected left-turns only.	Maintenance items; install signs, curbs, and install lighting on US 27.
25	Legacy Park Blvd / Florence Villa Grove Rd	Signalized	N/A	Maintenance bike lane and realigning crosswalks, install pavement markings, install street lighting on US 27.
26	Polo Park Blvd	Signalized	N/A	Install signs, street lighting on US 27, sidewalk, and pavement markings; maintenance items.

The short-term operational intersection improvements were developed to address specific failures identified at study intersections, focusing on locations where the LOS D target was not met under existing peak hour conditions. For example, the signalized intersections at Sand Mine Road and Cypress Gardens Boulevard are performing at LOS E during one of the study peak hours. Lane repurposing in addition to signal optimization bring performance back to an acceptable LOS D. Most unsignalized intersections are being proposed to be converted into a bi-directional median opening, which would greatly reduce the cross-street approach delays an improve safety. Synchro reports are provided in **Appendix O** showing the AM and PM peak hour intersection operational analysis results, assuming the Short-Term Improvements are in place.

Improvement recommendations require further assessment, include the access management recommendations. These require analysis on a corridor-wide basis. To determine the ultimate locations that should be modified and corresponding upstream and downstream modifications needed along the corridor, an Access Management Plan for the entire section of US 27 is recommended. In addition, the future conditions analysis should be completed to determine whether the access management recommendations will complement recommended future improvements for the US 27 corridor. These recommendations are being provided to appropriate FDOT offices for further review and assessment. The short-term improvements are also depicted by type and by location along the US 27 corridor on **Figure 8-1**.

Legend

Short Term Improvements

From Traffic Operational Analysis:

- Intersection lane additions / modifications
- Signalize intersection
- Convert to bi-directional median opening
- Modify signal timing / phasing

From Roadway Safety Audit:

- Additional signage / pavement markings
- Maintenance repairs
- Signal phasing modification
- Convert to bi-directional median opening
- Lighting improvements

9 EXISTING CONDITIONS SUMMARY

The NE Polk US 27 Mobility Study is intended to support the Florida Department of Transportation (FDOT) District One and its transportation partners in defining a multimodal program of improvement projects and strategies. US 27 is part of the Strategic Intermodal System (SIS) and is a critical north/south route for freight traffic throughout the state. The overall objective of the Study is to improve the mobility, safety, and livability along the US 27 corridor. This multimodal plan will address congestion and mobility issues on US 27 by developing Context-Sensitive Solutions, and documenting improvement strategies.

The purpose of the NE Polk US 27 Mobility Study is to engage local and regional project stakeholders to identify mobility needs and establish planning goals and values that lead to implementation of improvement strategies. The purpose of the Existing Conditions Report is to document the data collection, research and existing conditions analysis completed for US 27 as part of the NE Polk US 27 Mobility Study.

9.1 STUDY AREA

The NE Polk US 27 Mobility Study corridor spans a 32-mile section of US 27 from SR 60 (the southern limit of the study area) to US 192 at the Polk County/Lake County line (the northern limit of the study area). The broader study area includes the area surrounding US 27 several miles to the east and west, along with other key crossroads and parallel roadways which have an impact on US 27 and are impacted by US 27.

Thirty-three existing signalized intersections, the unsignalized interchanges of US 192 and US 17, and 14 unsignalized intersections with full median openings on US 27 between SR 60 and US 192 were identified as the key study intersections for the Existing Conditions Report.

9.2 OTHER STUDIES AND PLANNED IMPROVEMENTS

Available studies and reports previously developed by FDOT and other agencies for transportation facilities within the study area were reviewed, to provide historical context and insight into the issues and opportunities surrounding the US 27 corridor and study area. Valid data and analysis documented in other studies was considered and utilized wherever possible. Documents reviewed included available comprehensive plans for Polk County and the municipalities within the study area, the Polk TPO 2040 Long Range Transportation Plan, FDOT District One Central Polk Parkway PD&E Study, Central Florida Expressway Authority (CFX) Poinciana Parkway PD&E Study, Polk TPO Transit Development Plan (FY 2017 – FY 2026), FDOT Central Office US 27 Multimodal Corridor Study, and the ongoing Florida's Turnpike Enterprise US 27 limited access managed lanes feasibility study information.

Plans for changes to the roadway network within the broader study area were researched. Ongoing and upcoming planned and programmed (aka committed) transportation projects were identified from each of the funding plans that were reviewed. This included projects from the Polk TPO's latest adopted 5-year Transportation Improvement Plan (TIP), the TPO's adopted 2040 LRTP, FDOT District One adopted Work Program for fiscal years 2020 through 2024, and SIS 1st Five Year Plan, SIS 2nd Five Year Plan, SIS Cost Feasible Plan, and SIS Multimodal Unfunded Needs Plan.

9.3 TRANSPORTATION DATA

Traffic Volumes

Historic traffic count data available from FDOT, TPO, Polk County, and others was obtained for roadway locations within the study area. In addition, traffic counts were conducted in association with this study, including 24-, 48-, and 72-hour volume/classification counts as well as turning movement counts. Such turning movement counts were collected during the AM peak period (6:30am-10:30am) and PM peak period (3:00pm-7:00pm) on a typical weekday, in November or December 2018. This data included pedestrian and bicycle counts at each location. The AM peak hour was determined to be from 7:15 AM – 8:15 AM and the PM peak hour was determined to be from 4:45 PM – 5:45 PM.

Existing (2018) Annual Average Daily Traffic (AADT) volumes were developed from the bi-directional counts. AADTs older than 2018 were adjusted by a 2% annual growth rate.

Existing Bicycle and Pedestrian Facilities

Bicycle facilities were inventoried along US 27 from SR 60 to US 192. The bicycle facilities present on the corridor largely consist of 5-foot paved shoulders, and generally are not designated as bicycle lanes with pavement markings. There are keyhole lanes near intersections with turn lane configurations throughout approximately half of the study area. However, these keyhole lanes do not match the latest FDOT design standard which includes bicycle pavement markings.

Pedestrian facilities were also inventoried along US 27. Sidewalks are sporadically located from SR 60 until approximately Mile Post 23, near Ernie Caldwell Blvd. There are generally sidewalk facilities located on both sides of the corridor from Ernie Caldwell Blvd to the northern terminus of the study area at US 192. Curb cuts are provided where sidewalks meet the roadway. Seven signalized intersections do not have pedestrian crossing pavement markings on all four legs of the intersection.

Existing and Planned Transit

The Lakeland Area Mass Transit District (LAMTD) administers and operates Citrus Connection, which includes all public transportation within Polk County. Citrus Connection provides 24 fixed-route service lines, with a fleet of 41 buses. An additional three routes within the county are paid for by Polk County and operated via a contract with LYNX. Citrus Connection also operates paratransit service, offering shared rides for those who are unable to use regular fixed-route buses. There are twelve existing bus routes serving the NE Polk US 27 project area study limits, and two new routes scheduled to begin service on October 1, 2019. On weekdays transit service is generally provided between 6am and 7pm for most routes within the study area. Nine of the routes have some service on Saturdays, generally from morning to early afternoon. None of the routes have service on Sundays. Six of the 12 routes have a 1.5-hour headway between busses, four of the routes have an hour between busses, one route has two hours between busses, and one route has variable headways.

The highest Citrus Connection bus ridership is on route 15 which runs between Winter Haven and Haines City along US 17/92. The second highest ridership is on route 30 which runs between the Winter Haven Downtown Terminal and the Eagle Ridge Mall along portions of Cypress Gardens Road and Waverly Road. Route 427 which runs along US 27 has an average weekday ridership of 92.

SunRail is a Central Florida passenger rail system serving the City of Orlando, and Volusia, Seminole, Orange and Osceola counties. It opened in 2014 and has expanded to now include 49 miles and 16 stations in four counties. It makes 40 trips per day. SunRail operates double-decker passenger rail cars on 30-minute headways during morning and afternoon peak periods and on less frequent headways midday. Trains run Monday through Friday.

A technical memorandum, completed in March 2015 for the Polk County TPO, evaluated the possible extension of SunRail passenger rail service into Polk County. The technical memorandum was completed in support of the 2040 Long Range Transportation Plan Update. Key information from the memorandum was summarized including potential staging alternatives for an extension, conceptual site considerations, conceptual feeder bus services, ridership propensity analysis, and other institutional considerations. An initial list of ten potential station locations was provided. Two potential station locations were recommended in Haines City, one station in Auburndale, and one in Lakeland. Funding, adequate ridership, and community development support are three key issues to overcome in trying to move the idea for a SunRail extension forward.

Travel Patterns and Travel Demand Model

As a part of this study, Origin-Destination (O-D) data for all vehicular trips on US 27 and for other roads within the study area, was collected using Streetlight Data. This data was used to determine travel patterns of traffic entering and exiting US 27 and the study area.

The travel demand model that will be used for this study is based on the current adopted District One Cost Feasible 2040 Regional Planning Model (D1RPM v1.0.3), with refinements made in conjunction with a May 2018 US 17/92 Haines City traffic study. The D1RPM is a travel demand forecasting tool developed by FDOT District One, in conjunction with the six District MPO/TPOs in support of their current 2040 Long Range

Transportation Plans (LRTP). This model was adopted by the Polk County TPO for use in developing traffic forecasts within the County.

The 2040 No-Build model was developed by applying appropriate base year validation refinements to the 2040 LRTP Cost Feasible model network. This included adding the I-4/CR 532 interchange area (Osceola County) network and socioeconomic data and forecast external station volumes. The base 2040 No-Build network was also revised to include the proposed Southport Connector, Poinciana Parkway extension to I-4 along the eastern boundary of the model, and the proposed Central Polk Parkway (CPP) project, from Polk Parkway to 91 Mine Road.

Truck and Freight Data

Multiple data sources of truck and freight data was obtained and reviewed to summarize the existing truck volume on the US 27 corridor, and freight commodity information in the study area. Based on the FDOT 2017 truck counts at stations along US 27 between SR 60 and US 192, the average percentage of truck traffic is 9.7%, with a minimum of 6.7% south of SR 530/US 192, and a maximum of 12.3% north of Central Avenue in Lake Wales. Daily truck volumes from the 2017 FDOT counts show the highest truck volume is between I-4 and SR 60, with over 3,000 daily trucks on most of this section of the corridor, and some portions with over 4,000 daily trucks.

On average, 5,436,094 tons of freight is transported on the US 27 corridor in the study area which translates to 5,617 million dollars of goods. This equals an average of 378,883 annual truckloads passing through this corridor. The number one commodity moved on the US 27 corridor in terms of tonnage hauled and average annual value hauled, is citrus fruits which account for 49% total annual freight tonnage. The freight flow from warehouses and distribution centers is the second highest commodity by tonnage and value. This is in keeping with the types of uses in the area, which include citrus processing plants and large regional warehouse and distribution centers.

Streetlight OD data was analyzed to determine travel patterns for commercial vehicles in the area. Approximately 1/4 of the commercial vehicle (truck) trips originating at the Central Florida ILC in Winter Haven proceed west on SR 60. Another 1/4 proceed west and then north on Rifle Range Road (CR 655), and roughly another 1/4 of the trips proceed east on SR 60, with the majority then heading north on US 27.

9.4 LAND USE DATA

Future Land Use Plans and DRIs

The current future land use plans of Polk County and the municipal governments within the corridor, as well as the 2045 population and employment forecast developed by the Polk TPO were reviewed. Generally, the broader study area is surrounded by agricultural and conservation lands. Low and medium density residential development is located along both sides of US 27 between SR 60 and US 192, along with some small areas for institutional, industrial and commercial use. Commercial land uses are primarily situated near SR 60, US 17/92, and I-4. There are multiple large water bodies also located within the study area.

DRIs are also important areas to note, where additional development can be expected in the future, if they have not yet fully developed. According to Polk County GIS data, there are 9 DRIs located within the study area. Most are approved for retail or multi-use development.

2045 Population and Employment

The Polk TPO developed their 2045 population and employment forecast concurrent with the NE Polk US 27 Mobility Study. Consistent with the 2040 forecast, the 2045 forecast places significant population and employee growth in northeast Polk County. The County is expecting to add over 250,000 people between 2015 and 2045. Likewise, employment growth is expected to increase in northeast Polk County by over 67,000 employees between 2015 and 2045.

Freight Attractors and Generators

Freight attractors and generators were identified in the study area using information available from the FDOT District One *Freight Mobility and Trade Plan*, dated 2016, the FDOT District One *Districtwide Freight Activity Center Connector Definition and Evaluation* study completed in 2019, and ongoing FDOT Central Office Advanced Geospatial Analytics project. According to the District One FMTP, citrus is one of the major

commodities produced, processed and transported in District One. Ninety percent of citrus is processed into juice in eight processing plants in the District. Polk County is home to five citrus processing plants. Three of these plants: Florida's Natural Growers, Dundee Citrus Growers Association and Haines City Citrus Growers Association, are all either adjacent to US 27 or located within approximately 2 miles from US 27. Mining products, cattle, sugar, vegetables and other fruits are other major products that are produced in District One and transported on US 27.

The centrality of Polk County between three of the largest metropolitan regions in the State of Florida (Orlando-Tampa-Miami), has made Polk County a prime location for manufacturing, warehouse, distribution center, and 3rd party logistics industry establishments. The City of Lakeland is a major freight hub in Polk County with a high density of manufacturing establishments, warehouses and distribution centers that contributes significantly to freight movements on US 27 in the study area. US 27 is the most significant non-interstate freight corridor in District One.

Twenty-one Freight Activity Centers (FACs) were identified in Polk County from which ten (10) are located near US 27 in the study area (within 5 miles of the US 27 corridor). These FACs are considered major freight trip generators and attractors as they comprise major freight generator businesses such as manufacturing, warehouses, distribution centers, and transportation and 3PL business establishments. Connector roads that provide access to the ten FACs and the Freight Mobility Corridors in District One were also identified. Figure 4-6 shows how the FACs are connected to US 27 through identified FAC connectors, distribution routes and other regional facilities. These are critical routes that should be maintained with a primary purpose of moving freight and goods.

Community Characteristics and Context Classifications

Primarily rural in landscape, Polk County supports a growing population that is less diverse than that of the State, with fewer working age adults. The fastest growing areas in the county since 2010 generally occur north of SR 60 and south of I-4 with additional pockets of growth focused just north of Lakeland and along US 27. When evaluated by age, the fastest growth in the county is for residents age 65 and over. Polk County hosts over a quarter million jobs. Employment is distributed across a range of sectors, with health care and retail serving as the primary employers. Most employment is focused near Lakeland and Winter Haven with a large employment center also located in Bartow. Smaller but numerous areas of employment are focused along major roadway corridors including US 27 and SR 60.

The FDOT context classification system describes the land use, development, and transportation network functionality along a travel corridor. This provides the basis for a qualitative analysis of the general character of the area as part of the FDOT planning process. The characteristics of the community within the US 27 Mobility Study area are generally suburban in nature. Only the area between the Lake Wales Ridge Wildlife Environmental Area to East Mountain Lake Cutoff Rd is expected to remain a rural area, which is due to the presence of the sensitive environmental lands. Along the US 27 corridor from SR 60 to US 192, the following FDOT context classifications are identified: C2 – Rural, C3C – Suburban Commercial, C3R – Suburban Residential, and C4 – Urban General.

9.5 PHYSICAL CHARACTERISTICS

Using the results of the *US 27 Multimodal Corridor Existing Conditions Data Study* produced by FDOT and dated February 2019, right-of-way information, bridge structures, utility, and drainage structure information for US 27 between SR 60 and US 192 was summarized. This information will be useful when evaluating potential future corridor improvements.

In addition, the FDOT access management classifications along the US 27 corridor were noted along with the spacing standards. Many segments have multiple driveways which do not meet the current spacing standards. Safe access to and from US 27 now and in the future is a concern along the corridor.

9.6 EXISTING CORRIDOR OPERATIONS

Regional Travel Patterns

Existing Origin-Destination information obtained from StreetLight data was used to identify and summarize existing regional travel patterns of all vehicles entering and exiting US 27 and/or the study area. Internal trips, regional trips, and external trips were analyzed for the study area. The regional travel patterns showed a

significant percentage of traffic travels north on US 27 and east on I-4, and in reverse, from the east on I-4 to the south on US 27.

Roadway Analysis

A variety of existing available data sources were utilized in order to identify "hot spot" locations (congested roadway segments). US 27 roadway segment level of service, and intersection level of service was assessed. In addition, a congestion assessment from RITIS INRIX data and Google Traffic for the US 27 corridor was completed.

Based on 2018 AADTs, US 27 from Blue Heron Blvd to Bates Road, and US 27 from Crane Drive to I-4 are operating at LOS F; below the FDOT LOS target D for an urbanized area.

The congestion scan of US 27 shows that traffic in the southbound direction is somewhat congested from US 192 to I-4 from 7am to 7pm, with heavy congestion frequently occurring between Deen Still Road and I-4 between 6:30am and 6pm. The heaviest congestion for southbound traffic on US 27 occurs at I-4 between 3pm and 6pm. In the northbound direction, US 27 traffic typically experiences some noticeable congestion between US 17/92 and Old Polk City Road between 7-9am, 11am-3pm, and 4:30-5:30pm. Northbound also typically experiences some congestion between I-4 and Deen Still Road from 7am-7pm.

Average speeds along US 27 in the northbound and southbound directions for all vehicles were obtained through RITIS. Average speed on US 27 dips down from approximately 45 mph to between 36 to 40mph in both directions from approximately 6:45am to 6:45pm on weekdays.

Average travel time along US 27 between SR 60 and US 192 is approximately 40 minutes in both directions between 12am and 6am. Between 6am and 5:15pm, travel time increases by 5 to 10 minutes for both northbound and southbound directions. After 5:15pm, travel times gradually decrease back down to approximately 40 minutes.

Based on the existing intersection operational analysis, 17 of the 47 study intersections are operating at LOS E or F, which is below the FDOT LOS target D, in either the AM or PM peak hours. In order to reduce delay at the intersections with an overall LOS E or F, minor operational (short-term) improvements were evaluated and are summarized in Section 8.

Bicycle and Pedestrian Analysis

Much of the corridor has an acceptable bicycle Q/LOS of C, except for approximately 3.7 miles of US 27 that has an undesirable LOS E or F. Pedestrian facility Q/LOS is acceptable at Q/LOS D for approximately 10 miles, and below standard (at LOS E) for approximately 21 miles.

9.7 CRASH ANALYSIS

Crash data for the study area was obtained for the years 2013 through 2017. The crash data included information including date of crash, location, number of vehicles involved, type of crash, number of injuries and/or fatalities, cause of crash, and estimated economic loss. The crash analysis results reveal that there was a total of 3,451 crashes within the study area during this five-year period (2013-2017). Of these 3,451 crashes, rear-end collisions were the most common crash type, accounting for 47.4% followed by heavy vehicle crashes (14.5%) and angle crashes (12.5%). A total of 136 crashes (3.9%) resulted in a fatality or severe incapacitating injury and 25% occurred during dark conditions.

Segment crash and intersection crash statistics were evaluated. A composite ranking factor based on the criteria described previously was developed to identify high crash locations. Using the top ten ranked intersections and two of the top ranked segments, three (3) audit teams were organized to conduct the road safety field reviews. The teams collected data at the intersections and segments to identify deficiencies of the existing conditions including sidewalks, lighting, crosswalks, transit facilities, signage, and midblock median openings. Potential improvements were identified. The road safety audits were published under a separate document as *FDOT D1 Road Safety Audit: US 27 from North of SR 60 to US 192,* dated June 2019. The recommendations are being considered along with the intersectional operational analysis recommendations as short-term improvements.

9.8 SHORT-TERM IMPROVEMENTS

Short term improvements were identified based on an analysis of existing 2018 traffic operations and safety analysis. Twenty-six intersection locations have operational and/or safety recommendations. The recommendations were grouped into the following categories:

- Intersection lane additions / modifications
- Signalize intersection
- Convert a median opening to a bi-directional median opening
- Modify signal timing / phasing
- Add signs or pavement markings
- Maintenance repairs needed
- Lighting improvement

These recommendations are being reviewed and coordinated with appropriate implementing agencies and offices.
